## Executive Summary

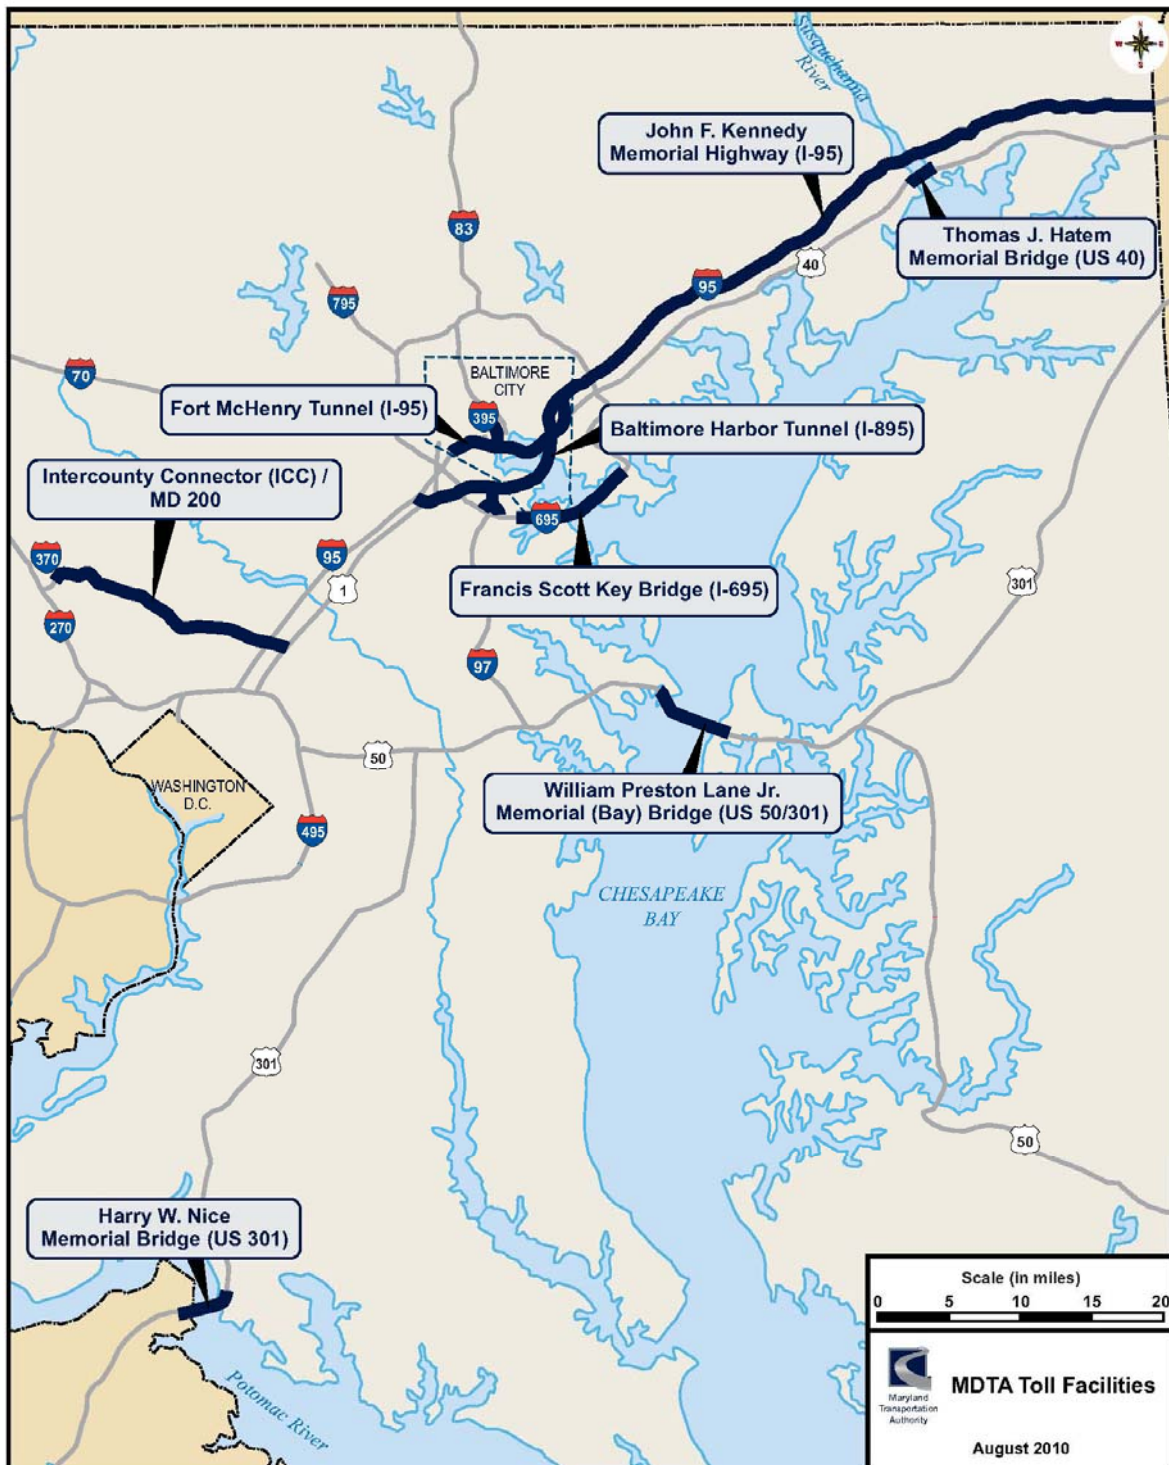

As the traffic and revenue consultant for the Maryland Transportation Authority (MdTA), Jacobs annually provides estimates of transactions and toll revenue for the MdTA's seven legacy toll facilities<sup>1</sup>. These seven facilities consist of one expressway, two tunnels and four bridges that provide critical transportation infrastructure links for both local and regional movement of people and goods. The seven facilities can be grouped into three geographic regions of the state: Northern, Central and Southern, and are shown along with the Intercounty Connector (ICC) in Figure ES.1 on the following page. As shown in the figure, all the facilities are on either Interstates or major US routes that cross bodies of water with very limited competing alternatives. Many serve as critical links in the northeast corridor highway network. In the Northern Region, the John F. Kennedy Memorial Highway (JFK) and Thomas J. Hatem Memorial Bridge (Hatem) provide regional and local connectivity across the Susquehanna River including critical east coast interstate travel connections. In the Central Region, the Fort McHenry Tunnel (FMT), the Baltimore Harbor Tunnel (BHT) and the Francis Scott Key Bridge (FSK) offer access under or over the Baltimore Harbor. In the Southern Region the William Preston Lane Jr. Memorial Bridge, commonly known as the Bay Bridge (Bay) crosses the Chesapeake Bay providing access between the metropolitan areas to the west and recreational areas on the coast. The Governor Harry W. Nice Memorial Bridge (Nice), also in the Southern Region, provides movement between Maryland and Virginia across the Potomac River. Transaction and toll revenue estimates for the Inter-County Connector and the I-95 Express Toll Lanes projects are not included in this analysis as forecasts for those facilities are provided by others.

In addition to estimates of transactions and toll revenue for these seven legacy toll facilities operated by the MdTA, estimates of toll and concession related revenue sources available to the MdTA were developed to provide a full picture of revenue potential for the Authority over the next ten year period.

The forecasts are based on the current toll and fee schedule as well as the toll increases approved at the September 22, 2011 meeting of the MdTA and identified as Appendix A to this report. These toll increases include those that were implemented in Fiscal Year 2012 as well as those planned for Fiscal Year 2014 (to be implemented on or about July 1, 2013). This executive summary presents the results of these work efforts including a review of the overall forecasting methodology as well as final estimates. The work, analyses, and forecasts for the existing legacy toll facilities are of investment-grade quality and suitable for financing. As part of the analysis, a traffic and toll revenue model for the existing legacy MdTA tolled facilities was developed. This model has the ability to adjust projections based on economic parameters and toll adjustments by the type of vehicle and payment method for each legacy toll facility.

<sup>1</sup> The legacy toll facilities include the JFK, Hatem, FMT, BHT, FSK, Bay and Nice toll facilities as defined in this section.

Figure ES.1: MdTA Facility Locations

The traffic and revenue model with resulting traffic and toll revenue estimates and projections were developed independently for each of the MdTA legacy tolled facilities, based on actual transaction and toll revenue data through the full MdTA fiscal year 2012 (FY2012) ending June 2012 and the first three months of FY2013, (July, August and September 2012). The MdTA fiscal year for 2013 runs from July 1, 2012 to June 30, 2013. All MdTA transaction and revenue data is based upon this fiscal year definition.

Reflecting the current slow economic recovery and the toll adjustments that occurred on November 1, 2011, January 1, 2012 and planned for July 1, 2013, Jacobs is forecasting a decline in tolled traffic on the MdTA's legacy toll system from FY2013 through FY2015, with a slow, steady recovery of traffic through the forecast horizon of FY2022. The forecast estimates that traffic levels will not return to the high level of FY2007 traffic within the forecast period.

These forecasts are reasonable and are appropriately conservative, taking into consideration the following:

- The previous forecast of traffic and toll revenue was met in FY2012, with actual revenue 2.1 percent above that projected. The models that were used to create the previous forecast was the basis for the current forecast;
- The forecast of traffic and toll revenue with the approved toll adjustments to be implemented in FY2014 uses conservative elasticity factors with the forecasted loss of traffic due to the toll increase being approximately twice the actual FY2012 toll adjustment experience;
- The planned toll schedule adjustments in FY2014 are relatively consistent across payment class such that motorists' movements to different payment classes represents little risk to revenue; and
- The forecasted long-term growth rate of transactions and toll revenue of approximately 1.0 percent after recovery is slightly greater than in the most recent past (FY2002-FY2007: 0.7 percent annual growth per year) due to emergence from recession but lower than previously experienced (FY1995-FY2002: 2.9 percent annual growth per year) due to changing demographics and consistent with the previously forecasted long term trends.

## Historical Transactions

During the course of the work effort, a complete set of available historical traffic and economic data sets were compiled. Historical transaction and toll revenue data were compiled from the MdTA for all the legacy facilities by month detailed to payment and vehicle class. Historical traffic and toll revenue data were also obtained from neighboring toll authorities to gain the most recent understanding of tolled traffic trends in the region. Additionally, other traffic counts in the region were reviewed to understand overall travel patterns in the region.

There were three areas of study concentration in the development of the transaction and toll revenue forecast for the MdTA facilities:

- Emergence from the recession;
- Evaluation of “normal” traffic growth; and
- Impact of the planned toll schedule adjustments.

Traffic on the MdTA facilities decreased from FY2007 to FY2009, flattened in FY2010 and increased in FY2011. In order to understand the current economic situation in an historical traffic context, Jacobs compared the current national traffic levels and MdTA transaction levels to previous recessions. This analysis demonstrated that the 2008 recession and current recovery from it may be fundamentally different from the previous recessions. While traffic began to recover in FY2011, traffic declined in FY2012 due to the toll increases implemented in November and January of the fiscal year.

Based on the forecasts of both national and state gross domestic products and anticipated employment recovery, Jacobs estimates that very modest recovery will continue through FY2013 and “new normal” growth rates for cars and trucks of approximately one percent are forecasted to occur in FY2014. These underlying growth forecasts assume no toll adjustment, providing a base from which to develop the forecast assuming the implementation of the approved toll adjustments in FY2014. With these toll adjustments, traffic is projected to decrease in FY2014 with slow steady “new normal” growth to occur in FY2015.

Figure ES.2 provides total MdTA transaction levels from FY1995 to FY2012. As presented in the figure, transaction growth decreased from 2.9 percent annually between FY1995 and FY2002, to 0.7 percent annually between FY2002 and FY2007. This decrease in growth predates all recessionary effects that began to be experienced starting in FY2008.

**Figure ES.2: MdTA Annual Actual Total Transactions**

This reduction of annual growth clearly indicates a change in travel characteristics in the region. Additionally, this trend follows the national trend of reductions in growth even before the recession and gas price changes. There are multiple reasons for this reduction in traffic growth, despite recent population and production growth increases in GDP and the Industrial Production Index. These reasons include, but are not limited to:

- Aging population;
- Workforce characteristics;
- Telecommuting; and
- Trip reduction and trip chaining (multi-purpose trips).

The experience of the recent past and the indication of changing travel characteristics pointed to the development of a “new normal” growth rate for the system. The approximately 1.0 percent “new normal” growth rate developed for the transaction forecast represents growth that is less than that experienced from FY1995 to FY2002 and slightly higher than the stalled growth of FY2002 to FY2007. The reduction of future growth rates as compared to the historical growth from FY1995 to FY2002 is based upon the changing demographics and travel characteristics we have seen in the region and across the nation. The slightly higher growth than the most recent positive growth trends from FY2002 to FY2007 is based on recovery from the recession.

The flattening of traffic in FY2010 and the slow recovery that started in FY2011 can be seen in this Figure as well. In FY2012 traffic decreased slightly in response to the toll increases.

### **Forecasted Transactions and Toll Revenues**

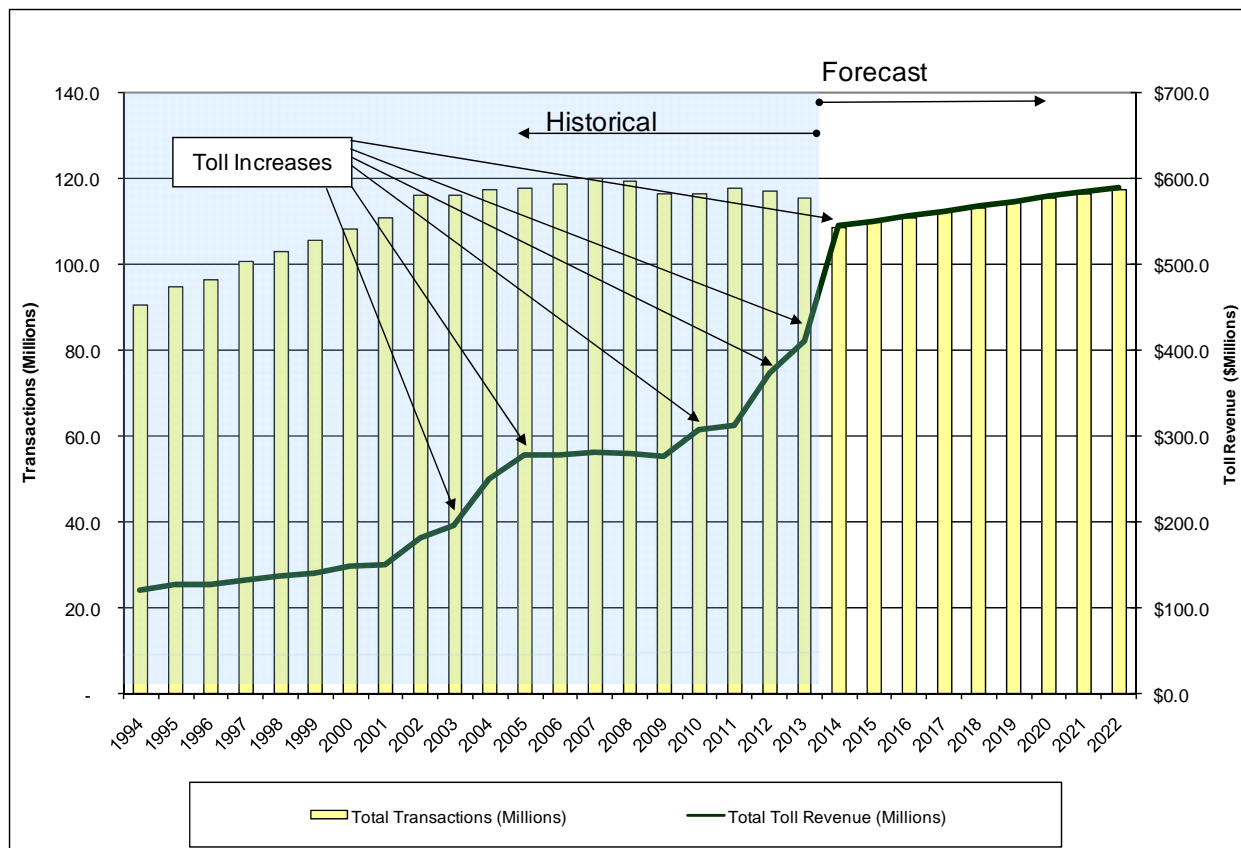

The transaction and in-lane toll revenue forecast was developed by vehicle class, payment type, for each of the seven facilities. In addition, the toll increases in FY2012 and FY2014 are recognized in this analysis. Due to the uncertainty of the current economic climate conservative elasticity factors were used in the analysis to provide achievable traffic and toll revenue forecasts for the legacy MdTA toll facilities. Historical and future forecasted transactions and in-lane toll revenue for the MdTA System are provided in Table ES.1. These data are also shown graphically in Figure ES.3.

Transactions are forecasted to decrease 1.4 and 5.8 percent from FY2012 to FY2013 and FY2013 to FY2014, respectively, while toll revenue is forecasted to increase by 10.3 and 32.4 percent for the same time period due to the phased implementation of the toll adjustment. Modest growth in transactions and toll revenue is expected to resume in FY2015, with a return to a “new normal” growth rate of approximately 1.0 percent per year for the remainder of the forecast.

**Table ES.1: MdTA Transactions and In-Lane Toll Revenues, Historical and Forecasted**

Fiscal Year	Total Transactions (Millions)	Total Toll Revenue (Millions)	Transactions Growth	Toll Revenue Growth
1994	90.4	\$121.1		
1995	94.9	\$126.9	4.9%	4.8%
1996	96.4	\$127.6	1.6%	0.6%
1997	100.5	\$132.4	4.3%	3.8%
1998	102.8	\$136.7	2.3%	3.2%
1999	105.6	\$140.9	2.7%	3.1%
2000	108.2	\$148.2	2.4%	5.1%
2001	110.8	\$149.9	2.4%	1.2%
2002	116.1	\$182.4	4.8%	21.7%
2003	115.9	\$197.0	-0.2%	8.0%
2004	117.4	\$251.3	1.3%	27.6%
2005	117.8	\$278.5	0.3%	10.8%
2006	118.6	\$278.8	0.7%	0.1%
2007	120.1	\$282.3	1.2%	1.3%
2008	119.5	\$279.3	-0.5%	-1.1%
2009	116.4	\$276.6	-2.5%	-1.0%
2010	116.3	\$308.5	-0.1%	11.5%
2011	117.7	\$312.0	1.2%	1.1%
2012	116.9	\$373.0	-0.6%	19.5%
2013	115.3	\$411.4	-1.4%	10.3%
2014	108.6	\$544.7	-5.8%	32.4%
2015	109.8	\$550.7	1.1%	1.1%
2016	110.9	\$556.6	1.1%	1.1%
2017	112.1	\$562.4	1.0%	1.0%
2018	113.2	\$568.1	1.0%	1.0%
2019	114.3	\$573.7	1.0%	1.0%
2020	115.4	\$579.2	1.0%	1.0%
2021	116.5	\$584.4	0.9%	0.9%
2022	117.5	\$589.7	0.9%	0.9%

**Figure ES.3: MdTA Annual Transactions and In-Lane Toll Revenue, Historical and Forecasted**

In addition to the forecasted transactions and gross toll revenues, Jacobs developed forecasts of various other revenue sources for the MdTA. These include unused toll revenue through the commuter program, transponder sales, monthly *E-ZPass* account fees, notice of toll due fees, violation fees, commercial discounts, over-size permits, concession revenues and revenue associated with the Hatem commuter program. Some of these revenues were allocated to the ICC facility as per the accounting structure of the MdTA. These revenue streams were also affected by toll adjustments in FY2012 and FY2014 as detailed in Appendix A. The forecasts are provided in Table ES.2.

**Table ES.2: MdTA In-Lane Toll Revenue and Other Revenues, Historical and Forecasted**

Fiscal Year	MdTA Toll and Other Revenue Estimates (\$ Millions) with FY14 Toll Increase															
	In-Lane Toll Revenue	Unused Toll Revenue	Transponder Sales	Monthly Account Fees	Notice of Toll Due Fees	Violation Fees	Commercial Vehicle Post Usage Discount	Commercial Vehicle High Frequency Discount	Over-Size Permit Fee	Concession Revenue	Hatem E-ZPass Program *	ICC Transponder Sales	ICC Monthly Account Fees	ICC Violation Fees	Total	Percent Increase of Total
2004	251.3	2.0				0.8	(2.3)			8.1					259.9	
2005	278.5	2.8				1.5	(3.9)			8.0					286.9	10.4%
2006	278.8	3.5				2.8	(4.5)			7.8					288.4	0.5%
2007	282.3	4.0				3.0	(4.8)			8.1					292.6	1.5%

\*Prior to this forecast Hatem Bridge AVI revenue was not forecasted separately. Now that it is an E-ZPass based program, it is forecast as "other revenue" as identified in this table.

## 1.0 Introduction

The Maryland Transportation Authority (MdTA) currently operates eight toll facilities within the State of Maryland consisting of two expressways, two tunnels and four bridges that provide critical transportation infrastructure links for both local and regional movement of people and goods. The eight facilities can be grouped into three geographic regions of the state: Northern, Central and Southern and are shown along with the ICC in Figure 1, on the following page. As shown in the figure, all the facilities are on either Interstates or major US routes that cross bodies of water with very limited competing alternatives. In the Northern Region, the John F. Kennedy Memorial Highway (JFK) and Thomas J. Hatem Memorial Bridge (Hatem) provide regional and local connectivity across the Susquehanna River including critical east coast interstate travel connection. In the Central Region, the Fort McHenry Tunnel (FMT), the Baltimore Harbor Tunnel (BHT) and the Francis Scott Key Bridge (FSK) offer access under or over the Baltimore Harbor and are known collectively as the Baltimore Harbor Crossings. In the Southern Region the William Preston Lane Jr. Memorial Bridge, commonly known as the Bay Bridge (Bay) crosses the Chesapeake Bay providing access between the metropolitan areas to the west and recreational areas on the coast. The Governor Harry W. Nice Memorial Bridge (Nice), also in the Southern Region, provides movement between Maryland and Virginia across the Potomac River. Separate traffic and revenue forecasts have been prepared for the ICC and I-95 Express Toll Lanes and are not included in this report.

Each toll facility under the MdTA charge has unique patronage and motorists' characteristics. This is tempered by similarities within each Region as many facilities offer redundancy of capacity, specifically in the Northern and Central Regions. The estimates of future traffic and toll revenue were based upon this understanding of historical experience as well as the changing economic environment.

Figure 1: MdTA Facility Locations

During the course of the work effort, a complete set of available traffic and economic data sets were compiled. Historical traffic and toll revenue data were compiled from the MdTA for all the facilities by month detailed to payment and vehicle class. Traffic and toll revenue data were also obtained from neighboring toll authorities to gain the most recent understanding of tolled traffic trends in the region.

The recent past and current local, national and global economic conditions are unparalleled in recent history. For this analysis, Jacobs has continued its extensive research into the most relevant historic and forecasted socioeconomic parameters in order to make a viable estimate of future traffic and toll revenues. The most recent recession began in December 2007 and lasted 18 months until June 2009 according to the National Bureau of Economic Research (NBER). This recession is comparable to the most significant previous recessions of 1973-1975 and 1981 -1982. Both of which were estimated to be 16 months in duration. The recovery from the current recession appears to be relatively jobless stoked by innovation and slow, derived from the lowering of inventory. As traffic is not simply a function of gross domestic product (GDP) but employment and production levels, a detailed review was undertaken and described herein.

The traffic and revenue model with resulting traffic and toll revenue estimates and projections was developed independently for the MdTA legacy tolled facilities, based on traffic and toll revenue data through the full MdTA fiscal year 2012 (FY2012) ending June 2012 and the first three months of FY2013, (July, August and September 2012). The MdTA fiscal year for 2013 runs from July 1, 2012 to June 30, 2013. All data in this report is presented as “fiscal year” following this convention. As part of the analysis a static trend line-based traffic and toll revenue model for the existing MdTA tolled facilities was developed. This model has the ability to adjust projections based on various economic parameters and is segmented by the type of vehicle and the specific toll facility. Additionally the model was augmented to provided forecasts based upon adjustments to the toll schedules by facility. The assumptions of future toll schedules for the analysis were derived from the changes approved at the September 22, 2011 meeting of the Maryland Transportation Authority and identified as Appendix A to this report. These adjustments included toll increases affecting FY2013 and FY2014. The work, analyses, and results for the existing tolled bridges are of investment-grade quality and suitable for financing.

As a result of the approved toll adjustments and the uncertainty in the short term economy, Jacobs is forecasting a decrease 1.4 and 5.8 percent from FY2012 to FY2013 and FY2013 to FY2014, respectively, while toll revenue is forecasted to increase by 10.3 and 32.4 percent for the same time period Modest growth in transactions and toll revenue is expected to resume in FY2015, with a return to a “new normal” growth rate of approximately 1.0 percent per year for the remainder of the forecast. The background and methodology that

led to Jacobs' traffic and toll revenue projections for seven of the eight toll facilities operated by MdTA as described previously are presented herein. Traffic and toll revenue estimates for the Inter-County Connector and the I-95 Express Toll Lanes projects planned by the MdTA are not included in this analysis.

## 2.0 Historical Toll Transaction and Toll Revenues

Historical toll transaction and gross toll revenue data were provided by the MdTA for Jacobs to use in developing a thorough understanding of the current state of the MdTA toll facilities. Additionally, other traffic counts in the region were reviewed to understand overall travel patterns in the region. These items are detailed in the following sections.

### 2.1 Historical Toll Transactions

This section provides a summary of historical toll transaction data for the MdTA’s legacy toll facilities. Data include annual transaction data, participation in the various payment options including special commuter programs, and vehicle class analysis, separating passenger cars and commercial vehicles.

Transactions on the MdTA facilities have steadily increased since the inception in 1940 as a result of both traffic growth on existing facilities and the introduction of new facilities, as illustrated in Figure 1. This growth is more prominent pre-1990 than in the more recent past. There have also been several annual drops in transaction levels, either as a result of overall economic recessions or, as in the case in 1991 and 1992, or the conversion of JFK, Hatem and Lane to one-way tolling, thus effectively reducing the number of transactions on those facilities by half. The recessionary periods are discussed in the economic section of this report. Also of note is the unprecedented flattening of traffic that predates the current recession, starting in 2002. This is shown more explicitly in Figure 2.

Figure 2: MdTA Historical Annual Transactions

**Figure 3: MdTA Recent Historical Annual Transactions**

Between FY1995 and FY2002, MdTA transactions grew at an average annual rate of 2.9 percent. For the next five years, from FY2002 to FY2007, transactions grew at 0.7 percent. This decrease in growth during the similar economic time periods from FY1995 to FY2007 is discussed in more detail in Section 3 of this report, specifically regarding the national and local trends in vehicle miles traveled (VMT). The decrease in traffic from FY2007 to FY2010 is a function of the recession, both the initial effects, with large decreases from FY2007 to FY2009, and the lingering effects with essentially no growth from FY2009 to FY2010. Additionally, tolls were increased for commercial vehicles in late FY2009 (May 2009), causing an estimated further decrease in traffic levels affecting both FY2009 and FY2010. It is estimated that the flattening of traffic in FY2010 marked the beginning of the recovery for the MdTA System, with sizable growth from FY2010 to FY2011 of 1.2 percent. In FY2012 transactions decreased by 0.6 percent due to the toll increases implemented during the fiscal year.

### 2.1.1 Historical Toll Transactions and Revenue by Facility

The following tables and figure show a breakdown of transactions by facility from FY1995 to FY2012, as well as annual percent changes. The data were provided by the MdTA through TVI reports through FY2012.

**Table 1: MdTA FY1995 – FY2012 Actual Toll Transactions by Facility**

**Figure 4: MdTA FY1995 – FY2012 Actual Toll Transactions by Facility**

Table 3 and Table 4 provide the FY1995 to FY2012 actual gross toll revenue as well as its growth by facility for the MdTA system. There are sizable increases in toll revenue that outpace transaction growth, specifically for fiscal years FY2002 through FY2005, FY2010 and FY2012. This is due to various toll increases that were implemented during these times. Table 5 provides the average toll by fiscal year by toll facility to demonstrate these increases. From FY2005 to FY2009 the average toll remained very stable because there were no adjustments to the toll schedule during this time. In FY2010 and FY2012 the average toll increased because of the toll increases implemented in that year. The average toll remained stable from FY2010 to FY2011 when no adjustments to the toll schedule were made.

## 2.2 Regional Traffic Review

In addition to the review of transactions on the MdTA facilities, a review of traffic volumes on competing as well as complementary facilities to the MdTA System was undertaken to understand overall traffic patterns in the region. For comparative purposes, the counts are provided by region, including MdTA and non-MdTA roadways. The following tables present the Northern, Central and Southern Regions' historical average annual daily traffic volumes and capitalized annual growth rate of those volumes between represented years. Note that for comparative purposes the one-way transactions for JFK highway and Hatem, Nice and Bay Bridges were doubled to compare to the two way volumes of the other roadways.

## 2.3 Historical Toll Transactions by Vehicle Class

The historical toll transactions on the MdTA facilities by vehicle class are shown in Table 12. As commercial vehicle usage of MdTA facilities reacts more acutely to recessionary times, the percentage of these vehicles as a function of total transactions has slightly declined since FY2009. The percent share of commercial vehicles on the System decreased from 7.9 percent in years leading up to FY2009 to 7.3 percent in FY2009 and further to 7.0 percent of total traffic in both FY2010 and FY2011. Additionally, commercial vehicles were affected by the toll increases in May FY2009 and January FY2012. It is evident this impact continued in FY2012, when commercial vehicle share dropped to 6.0 percent of total traffic.

**Table 12: MdTA Historical Toll Transactions by Vehicle Class**

Fiscal Year	MdTA Facilities - Transactions (Millions)			% CV
	Passenger Cars	Commercial Vehicles	Total	
1995	86.6	8.3	94.9	8.7%
1996	88.2	8.1	96.3	8.4%
1997	92.1	8.4	100.5	8.4%
1998	94.2	8.6	102.8	8.4%
1999	96.6	9.1	105.7	8.6%
2000	98.6	9.6	108.2	8.9%
2001	101.3	9.5	110.8	8.6%
2002	106.9	9.2	116.1	7.9%
2003	106.9	9.0	115.9	7.8%
2004	108.1	9.3	117.4	7.9%
2005	108.4	9.4	117.8	8.0%
2006	109.2	9.4	118.6	7.9%
2007	110.6	9.5	120.1	7.9%
2008	110.1	9.4	119.5	7.9%
2009	108	8.5	116.4	7.3%
2010	108.3	8.1	116.3	7.0%
2011	109.5	8.2	117.7	7.0%
2012	109.0	7.0	116.0	6.0%

MdTA commuter plans offer passenger car motorists up to 75 percent cost savings based on the most recent toll adjustment in FY2012. These savings have enticed a significant portion of motorists into the program, which peaked in FY2008 as presented in Table 13. The participation in commuter plans on the MdTA system declined slightly from FY2008 to FY2011 from a high of 35 percent of all passenger car transactions in FY2008 to 32 percent in FY2011. One likely reason for this slight decline in participation from FY2008 to FY 2011 is the change in the commuter program from allowing for a set number of trips at the reduced rate in a 45 day period instead of a 60 day period. In FY2012, commuter transactions as a percent of total increased from 32.0 percent to 34.6 percent. This is partially the result of the economic recovery, allowing more commuters on the roadway as well as the toll adjustment that, while tolls increased for all payment classes, the absolute increases were generally less for commuter vehicles as compared to non-commuter vehicles.

**Table 13: MdTA Commuter Plan Participation**

Fiscal Year	MdTA Facilities - Transactions (Millions)			
	Commuters	Non-Commuters	Total Passenger Cars	Percent Commuters
2004	32.1	76.0	108.1	29.7%
2005	36.5	72.0	108.4	33.6%
2006	37.4	71.9	109.2	34.2%
2007	38.3	72.3	110.6	34.6%
2008	38.5	71.6	110.1	35.0%
2009	37.4	70.5	108.0	34.7%
2010	35.7	72.6	108.3	33.0%
2011	35.0	74.5	109.5	32.0%
2012	37.7	71.3	109.0	34.6%

The counterbalancing of the decrease in commercial vehicle transactions and commuter discount plan participation as a function of the total transactions has allowed for a relatively flat average toll rate, as presented previously in the report. These trends are a significant input for the development of the projections of traffic and gross toll revenue that are provided later in the report.

## **3.0 Economic and Demographic Factors**

During the course of this analysis, Jacobs analyzed several key socio-economic factors relevant to the growth in traffic and related toll revenues for the MdTA tolled facilities. Factors that are relevant to the long term background growth of traffic on the facilities were studied, as was the relationship of traffic to specific economic indices for passenger car and truck traffic. Jacobs also conducted extensive background research into the specific dynamics of past economic recessions and recovery from those recessions in order to better understand the current phenomenon and to aid in giving context to the most recent economic downturn when compared with past recessions. The analyses are summarized in the following sections.

### **3.1 Review of Regional and National Socio-economic Factors**

This section discusses historical and forecasted national economic conditions with an emphasis on the projected growth in output. Moreover, this section provides a review and summary of local economic factors, such as the change in fuel costs, population, employment, housing, and commuter patterns in Maryland and in neighboring states.

#### **3.1.1 General National Economic Conditions**

From 2000 to 2010, real Gross Domestic Product (GDP) and the Industrial Production Index in the U.S. increased by an average of 1.8 percent and 0.6 percent per year, respectively. This includes the recession that began and ended in 2001 and the most recent recession, which began in December 2007 and officially ended in June 2009. This recent recession has been more severe compared to previous recessions, resulting in zero growth in real GDP and a -3.3 percent decrease in industrial production in 2008. Real GDP decreased by an additional -2.6 percent in 2009, but recovered in 2010 with a 2.9 percent annual increase. Due to a lag in economic activity, industrial production decreased by -9.3 percent in 2009, but rebounded solidly in 2010, with over 3 percent annual growth. Real GDP increased by 1.7 percent in 2011 and by an annualized rate of 2.0 percent and 1.5 percent in Q1 and Q2 of 2012, respectively. Figure 5 compares year-over-year changes in real GDP since 1960.

Figure 5: Percent Change in Real GDP, 1960 - 2011

Recessions are technically defined as two consecutive quarters of negative growth. In determining whether a recession has taken place, the National Bureau of Economic Research (NBER) can include other factors in its analysis. According to the NBER, the 2007-2009 recession lasted 18 months, making it the longest economic downturn since the Great Depression, as shown in Figure 6. Additionally, this recession is comparable to and may possibly exceed the recessions of the early 1970s and early 1980s in duration and severity. Economic downturns that have occurred after the Great Depression have typically been triggered by a contracting monetary supply (typified by higher interest rates) or an external shock (e.g. sudden rise in oil prices, political turmoil, etc.) resulting in decreased consumer confidence, economic growth, and employment. Once expansionary conditions are in place, then post-recessionary periods have typically been characterized by rapid, strong and sustained increases in GDP and employment.

Figure 6: Duration of US Recessions, 1920-2012

In contrast, the recent recession was caused by the near collapse of the financial sector, the lack of available credit, a rapid decline in the price of real estate assets, and high consumer debt levels. The subsequent deleveraging by consumers and businesses tends to have a more severe, longer-term impact on the economy. Indications of credit tightening and deleveraging include the following:

- Housing prices tracked by the S&P/Case-Shiller Index decreased by 11% in 2008 and 19% in 2009, respectively, as shown in Figure 7.
- Outstanding consumer credit declined by 6% from \$2.6 trillion to \$2.4 trillion from 2009 to 2011 as shown in Figure 8.
- Securitized asset pools decreased precipitously—from \$682 billion to \$127 billion from 2008 to 2011.

Figure 7: S&P/Case-Shiller 10 City Index

Due to a lag, outstanding consumer credit declined by -6% from \$2.6 trillion to \$2.4 trillion from 2009 to early 2011. In particular, securitized asset pools decreased precipitously—from \$682 billion to \$127 billion from 2008-11. Consumer credit is detailed by sector in Figure 8. These conditions are more similar to the underlying causes and impacts of the Great Depression. Recent economic research indicates that the root causes of these contractions lead to weaker and fragile recoveries until the financial sector stabilizes, asset prices recover, and deleveraging by consumers and businesses is concluded. Consequently, economic growth is expected to be sluggish with high unemployment over longer periods of time. Recent forecasts anticipate that sustained economic growth in the United States will resume in 2014 or 2015, depending on local conditions.

Figure 8: Outstanding Consumer Credit

### 3.1.1.1 Long-Term Structural Trends

The recent recession has coincided with a number of long-term structural trends in the U.S. and internationally which have encumbered economic growth and employment creation. First, there have been significant productivity improvements in the form of advances in information technology, computing power, transportation, and communications. These advances encouraged the transfer of manufacturing facilities and jobs to areas with higher unemployment and lower wages. This has also shifted the engine for economic growth in the U.S. from manufacturing (from 31 percent of GDP in 1970 to 23 percent GDP in 2010) to services (from 32 percent of GDP in 1970 to 47 percent of GDP in 2010). The technology boom of the 1990s and the subsequent bust in the early 2000 intensified these trends, encouraged the expansion of inexpensive communications technologies, and further flattened factor and wage costs, internationally. Increasingly, this has led to the outsourcing of professional services. For example, X-rays can be evaluated or financial statements can be prepared cheaply and rapidly almost anywhere in the world where technical capacity exists.

Second, there has been a restructuring of the international economy with traditional trading partners (Europe and Japan) generating a decreasing share of global GDP, while other economies including Brazil, Russia, India and China (“the BRIC countries”), comprising a larger share of the global economy. For the U.S., this has resulted in

greater competition not just in manufacturing, but also in professional services, reducing direct and indirect employment.

A third trend has been the aging of the U.S population. The median age has increased from 27.9 in 1970 to 37.2 in 2010. This trend has also taken hold in Europe and Japan and is expected to eventually impact China due to its one-child policy.

Finally, there has been a rapid and significant expansion in consumer credit, which has reached unsustainable levels. As a result, consumers have reduced or deferred large discretionary purchases, such as vehicles and appliances, until debt levels have decreased to more manageable levels. These factors tend to further dampen economic growth and employment over the short-term.

### **3.1.1.2 Short-Term Economic Forecast**

In early 2012, there was modest enthusiasm with respect to economic growth and employment, which has decreased slightly as the year has progressed. Forecasts prepared in August 2012 have reduced the forecasted growth in real GDP. The median of selected economic forecasts developed by financial institutions and industry analysts for real GDP in August 2012 (see Figure 12) was 1.7 percent, down from 2.2 percent at the start of the year. The spread among forecasts (50+ observations) is relatively small, ranging from 1.9 percent to 2.5 percent. For 2013, the consensus forecast was that real GDP would increase by 2.1 percent, albeit with a wider range—0.9 percent to 3.7 percent. Factors that may negatively impact real GDP in the short-term include the following:

- Recessionary conditions in Europe due the weak fiscal position of Greece, Portugal, Spain, and Italy and concerns about the stability of the Euro;
- Signs of decreased economic growth in Brazil and China;
- The currently scheduled the \$500 billion budget cuts and/or tax increases at the end 2012. The U.S. Congressional Budget Office (CBO) warned that the upcoming “fiscal cliff” could result in a return to recessionary conditions; and
- Increased tensions in the Middle East.

The previous and revised forecast of Real GDP for 2012 and 2013 are presented in Figure 9 and Figure 10, respectively. (As of this writing, the U.S. Federal Reserve Bank (FRB) and the International Monetary Fund (IMF) have not yet revised their forecasts.) Factors cited in these revised forecasts include slower than expected economic growth, higher than expected unemployment, flattened consumer spending, weakness in the housing market and new construction, stock market volatility, and the recent downgrade in the U.S. credit rating by Standard and Poor’s. The revised forecasts, especially for

2011, barely exceed population growth, which increased by an average of 0.9% per year from 2000 to 2010.

**Figure 9: Real GDP Forecasts for 2012, Previous and Revised**

**Figure 10: Forecast Change in Real GDP, 2012 and 2013**

Source: Blue Chip Economic Indicators (BCIE)

These factors have renewed concerns of the possibility of a second or “double-dip” recession within the next 2-3 years, which last occurred in the early 1980s. As of this writing, none of the revised forecasts are predicting a return to recessionary conditions. Moreover, the Federal Reserve is planning to maintain its policy of low interest rates and possibly conduct another round of quantitative easing to spur economic growth.

Revised forecasts are generally calling for sluggish economic growth and weak labor market conditions in 2011 with a slight improvement in 2012. Possible signs of a second recession have also not yet materialized. For example, the yield curve remains positive with short term interest rates (0-12 months) on U.S. Treasuries trading at or near zero and the interest rates on 30-year U.S. Treasuries trading at 3.75%, as of August 23, 2011. Additionally, the market for crude oil remains strong with the price expected to be close to \$100/barrel for this year and next. In comparison, the price during 2009, which corresponded to the steepest part of the recession, averaged approximately \$62/barrel.

If the forecasts calling for continued slow growth materialize, then the economy will remain vulnerable to exogenous risks, which could potentially drive the U.S. economy back into recession. External events that could bring on a second recession include the ongoing European debt crises, continued volatility in the stock market which reduces investor and consumer confidence, continued instability in the Middle East, or a natural disaster (e.g. the 2011 earthquake in Japan). In particular, the European debt situation represents a key external risk that could affect economic recovery in the U.S. At the present time, there are concerns that Ireland, Portugal or Spain may join Greece in requiring assistance from the European Union or the IMF in order to avoid default. French banks are particularly exposed, which could result in a second round of financial contagion, further retrenchment in the financial sector, and another recession.

The consensus forecast developed in August 2012 puts the odds of a return to recession in the U.S. at approximately 25% as there are also positive economic signs. The yield curve remains positive with short term interest rates (0-12 months) on U.S. Treasuries trading at or near zero and the interest rates on 10-year U.S. Treasuries trading at 2.82%<sup>2</sup>. The market for crude oil remains strong with the \$/barrel price at just below \$96/barrel. Barring an unforeseen event in the international political environment, the Energy Information Administration (EIA)'s forecast prepared in June 2012 anticipates that crude oil price will fluctuate between \$90/barrel to \$94/barrel from through 2012-13.

Our outlook is for relatively flat economic growth of 1.7% for 2011 and 2.2% for 2012, which represents the median of the revised economic forecasts developed by financial institutions and business associations in the short term. It is anticipated that a slow recovery will emerge in the medium term in contrast to robust recoveries of previous recessions. This fits with the current base case forecast provided by Jacobs for the MdTA facilities.

<sup>2</sup> As of August 22, 2012

### 3.1.1.3 Industrial Production

Changes in U.S. industrial production have historically moved in tandem with GDP, albeit with steeper decreases during recessions and larger increases during recovery periods. During the lowest point of the 2001 recession, the Industrial Production Index (IPI) decreased by 4.0 percent as shown in Figure 11. Due to the severity of the 2007-2009 recession, IPI declined -13.5 percent in 2009. Since then, IPI has recovered increasing by 5.4 percent and 3.4 percent during 2010 and 2011, respectively. Despite this recovery, the gross value of the IPI for “Final Products and Non-Industrial Supplies” is at 97 percent of its 2007 peak.

Figure 11: Percentage Change in Real GDP and IPI, 1989-2011

Source: U.S. Federal Reserve Bank

Similar to the IPI, the utilization of U.S manufacturing capacity also decreased significantly in 2009, as seen in Figure 12, declining to 0.692. Since then, capacity utilization has recovered to 0.773. Notwithstanding, capacity utilization is currently 95 percent of the historical median value, 0.805, from 1990 to 2011.

**Figure 12: Capacity Utilization, 1990-2011**

Source: U.S. Federal Reserve Bank

### 3.1.1.4 Industrial Production Forecasts

Based on forecasts developed by financial institutions and industry analysts, the Industrial Production Index (IPI) is forecasted to increase by 4.1 percent in 2012 and 2.8 percent in 2013. This slower forecast likely captures the decrease in exports due to the recessionary conditions in Europe and slower growth in emerging markets, including Brazil and China. Selected forecasts are shown in Figure 13.

**Figure 13: Forecast Change in the Industrial Production Index, 2012 and 2013**

Source: Blue Chip Economic Indicators (BCIE)

### 3.1.1.5 Employment

At the beginning of 2008, the national unemployment rate was 5.0 percent. By October 2009, unemployment peaked at around 10.0 percent. During 2008 and 2009, total employment decreased by 3.2 percent each year. Total employment started to recover in subsequent months with a 0.9 percent increase in 2010 and a 1.5 percent increase in 2011. The unemployment rate has decreased gradually to 8.1 percent by August 2012. Long-term forecasts of employment tend to differ, depending on varying considerations of the potential impact of long-term structural trends, such as advances in information technology, outsourcing of jobs, and an aging population.

The U.S. Congressional Budget Office (CBO) has forecasted that employment would return to historical levels by 2015. However, other institutions and economic analysts are predicting historically high levels of unemployment in the U.S. through 2015 and beyond. In any event, the most recent recession has had a more severe impact on employment, especially compared to previous downturns other than the Great Depression. Similar to the Great Depression, the decrease in employment levels has been steeper and the recovery has taken a relatively long time to take hold.

### 3.1.2 National Trends in Vehicle Miles Traveled (VMT)

The United States has experienced a never before seen flattening, then drop, in vehicle-miles traveled (VMT) on its highways over the past several years. A reduction in VMT means less revenue – in the form of gas tax or tolls - for funding transportation projects. Jacobs reviewed and compiled available reports and data to investigate the possible factors contributing to this phenomenon.

Figure 14 depicts the 12-month moving total of national travel mileage from 1940 through July 2012 on all U.S. highways. As seen in this figure, there were temporary reductions in VMT during World War II, oil crises and economic recessions. Despite these temporary “dips”, the VMT continued to grow rapidly over the years. It shows that, in recent years, with the exception of short, flat periods during the 1991 and 2001 recessions (each less than one year), VMT grew at a steady pace through about 2005. VMT then grew at a much slower pace through 2008. The increase in gas prices and the downturn in economic activity that took hold in late 2008 resulted in a significant reduction in total national travel mileage after December 2007 peak. While VMT declined throughout 2008, it has remained flat in 2009 until the summer months, when there was a slight increase over the previous year. This perceived growth was due in part to the large reduction in summer gas prices from 2008 to 2009. Since the recession ended, there have been slight increases and decreases in VMT from month to month that may have been caused by large fluctuations in gas prices.

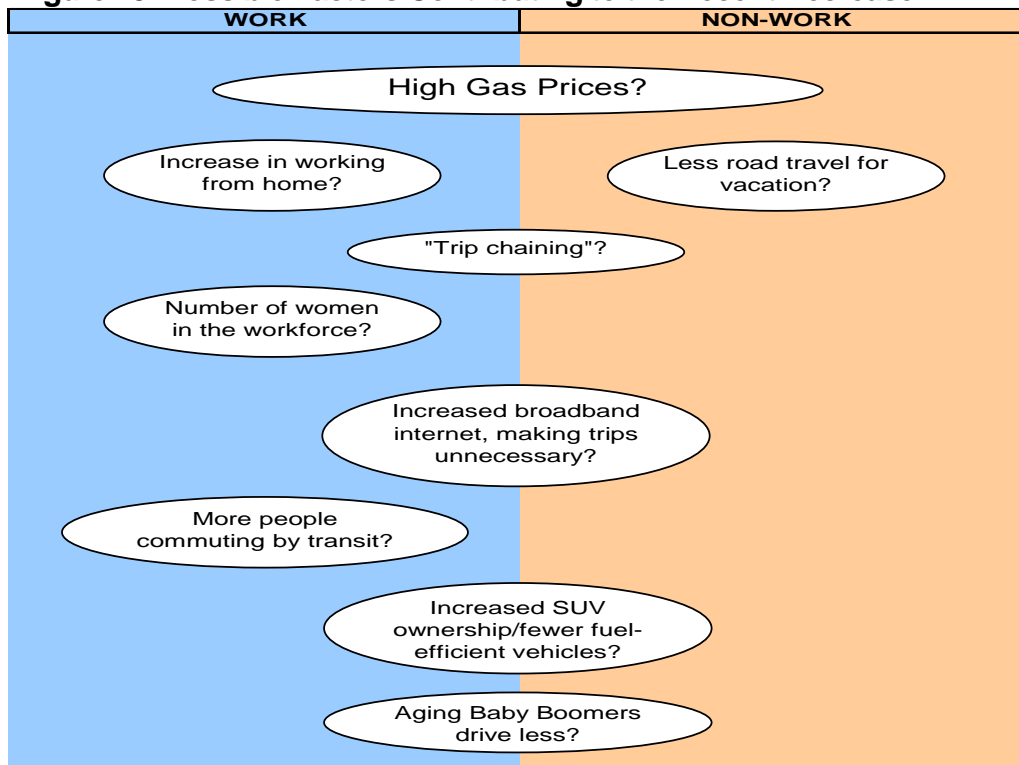

**Figure 14: US Annual Vehicle Miles Traveled (VMT)**

Source: Federal Highway Administration (FHWA)

Figure 15 lists some of the economic, demographic, and behavioral factors that may have caused the recent drop in VMT that are outside of the direct impact of the recession. The purpose of identifying these non-economic factors, is to isolate changes in travel characteristics that change the historical relationship between economy (and employment) and travel. This list includes the factors that impact work and non-work related trips. It should be noted that some factors affect both trip types.

**Figure 15: Possible Factors Contributing to the Recent Decrease in VMT**

Source: Jacobs Consultancy

Figure 16 compares the annual change in VMT to the annual increase in total population and the number of licensed drivers in the U.S. Historically, total VMT in the U.S. has increased at a higher average annual rate compared to population and the total number of licensed drivers.

**Figure 16: US Population and Licensed Drivers vs. VMT (Indexed to 1960=1)**

Sources: FHWA; U.S. Census

**3.1.2.1 Fuel Costs**

A number of factors may have caused the recent drop in VMT; the jump in gas prices is often cited as a key factor. During the period of rapid oil and gasoline price increases in the summer of 2008 experts in the toll forecasting field tried to bring some perspective to the phenomenon by formulating opinions as to how motorists would modify their driving habits in lock step with price escalations. This same exercise is currently being conducted once again as the wildly fluctuating prices take hold of the economy. This is particularly important to toll road agencies as they attempt to plan for the future. In this section, we will take a look at historical and forecasted gasoline prices, our view of the motorists' perception of the fluctuating prices, historical traffic data in the face of such fluctuations and finally what the future may hold for motorists and toll road operators.

Figure 17 presents the historical and projected gasoline and crude prices from the US Energy Information Administration (EIA). The graph illustrates the peaking of gasoline prices in the summer of 2008, the precipitous drop in late 2008, and the subsequent rise to another price spike in May 2011. Prices declined by throughout the summer and fall of 2011, reaching a low point in December 2011, followed by a sharp increase in April 2012. In recent months, average prices have fluctuated between about \$3.40 and \$3.80. In their

September 2012 report, the U.S. Energy Information Administration projects prices to continue declining to about \$3.25 by late 2013, with a seasonal peak of about \$3.55 in May 2013.

**Figure 17: Historical and Projected US Gasoline and Crude Oil Prices, EIA**

This relatively static forecast of future oil and gas prices may be reassuring, however, what this graph does not show is the level of uncertainty in these projections. Figure 18 presents the projection of West Texas Intermediate Crude Oil Price. The base projection is obviously similar to that of Figure 17, but it is the possible range of this price that is disconcerting. Based on the options markets the 95 percent confidence interval for WTI is between 83 percent more to 42 percent less than current estimates for December 2013. With a wide range of possible future prices of oil and gasoline, projecting traffic volumes has become an increasingly difficult task.

**Figure 18: Historical and Projected Crude Oil Prices with Confidence Range, EIA**

Another consideration is the decreasing reliance on oil and gasoline as the fuel for our vehicles with the increasing fuel efficiency of vehicles, as shown in Figure 19. The sharp increase in fuel efficiency in the late 1970s was caused by the oil crisis and the trend toward buying smaller, more fuel-efficient vehicles. A gradual decline in average MPG from 1987 through 2004 occurred as larger vehicles and SUVs became more popular. From 2005 through today that trend was again turned around, and today vehicles are more fuel-efficient than ever. This means that, generally speaking, gas prices today do not have as large an effect on drivers as it did ten years ago.

Also to consider in this discussion is the emergence and growth of hybrid and electric vehicles in the marketplace. These alternate fuel vehicles, while they of course rely on some sort of fuel source, may not be so dependent on oil in the future and a wider range of energy options from natural gas, coal, nuclear and possibly renewable sources such as solar and wind. It has been estimated that electric vehicles could constitute up to 35 percent of the market by 2025. Though these predictions vary widely by source, what is important to understand is the potential for mitigation of rising oil prices by motorists.

**Figure 19: Historical Fuel Efficiency, 1975-2011**

Source: epa.gov

To understand the potential impact of future gas prices on traffic we can look at historical reactions. Figure 20 presents historical VMT across the United States as compared to gasoline prices from 1990 through 2012. Both the VMT and real gas prices represent a 12-month moving average to remove any seasonality factors; all data are indexed to the 12 months ending January 1990. While the Great Recession began in the fall of 2008, there was still a flattening, then decline, in vehicle miles that started several years before. This may be partially attributed to rising gas prices. The continuation of the decline, post-fall 2008, would be more attributable to the economic meltdown, as gas prices dropped significantly by early 2009. Gas prices have generally increased since then, and VMT has slightly declined. Due to the recession and slow recovery period, it has been difficult to pinpoint the elasticity of travel as it relates to gas price, however, we can roughly estimate about a 5 percent loss in VMT nationwide due to the doubling in gas prices from 2003 through today.

**Figure 20: National VMT vs. Real Gas Prices, 12-Month Moving Average, 1990-2012**

Continuously high gas prices could permanently modify the typical American's perception of our assumed right to drive our vehicles in the manner to which we are accustomed. There are, of course, a number of longer term strategies that could be undertaken to help offset the effects of oil/gasoline price peaking, including some of the following:

- Mandatory as well as voluntary increases in fuel efficiency
- Increased transportation mode choice shifts,
- Regulation of pricing
- Increased taxation
- Rationing
- Increased production and use of non-petroleum fuels.

In addition there are a number of new technologies that might help replace oil consumption in transportation thus mitigating the continued dependence on oil and the resultant price rises on gasoline. These include some of the following:

- The use of Ethanol and Biodiesel fuels,
- Coal and Biomass Gas-to-liquid (GTL)
- Natural Gas
- Advanced Vehicle Technologies which should include:
- increasing the efficiency of the internal combustion engine,

- continued proliferation of hybrid electric and plug-in hybrid electric vehicles,
- continued ongoing work to improve the efficiency of conventional vehicles, and
- continued work on the use of Hydrogen Fuel Cell Vehicles.

All of these envisioned efforts depend on the continued subtle changes in the market forces on the speculation of futures related to oil prices; gradual, less dramatic rises in the price of oil crude per barrel; already anticipated resources which dictate supply and demand, and finally, the mitigation of all the natural forces of weather and other “acts of God” on the availability of crude oil on which to run our economic engines. What is not envisioned, and cannot be sustained for a very long period of time, is that nothing is done to mitigate our oil dependency while waiting for one or more of the changes mentioned above to become anything more than a “subtle change” and enter the realm of dramatic, unavoidable or unanticipated.

What is equally certain is that the future continues to be unknown, and that over the next few years increases in oil prices caused by disruptions to supply and demand, natural disaster or artificially speculative market forces, will not only change our driving behavior, but ultimately become a very significant challenge to an increasingly global economy. The measurement of how dramatically each rise in the price per barrel of oil makes on travel beyond the currently-known relationships is, of course, related to the specifics of individual markets.

### 3.1.2.2 Work vs. Non-Work Travel

The 2001 National Household Travel Survey converted the number of trips by purpose and distance into VMT, which is summarized in Table 14. According to the 2001 survey, trips commuting to/from work and work related trips accounted for more than 35 percent of total VMT. The next highest categories were trips related to social/recreational activities and family/personal business, which accounted for 25 percent and 19 percent of total VMT, respectively. In addition, shopping related trips accounted for 15 percent of VMT. Finally, other trips, which include medical and religious related trips, accounted for about 7 percent of total VMT in 2001.

**Table 14: Share of VMT by Trip Purpose, 2001**

Purpose	Percentage of Total VMT
Commuting and Work Related Business	35.4%
Social/Recreational	24.4%
Family/Personal Business	18.7%
Shopping	14.5%
Other	6.9%

*Source: 2001 National Household Travel Survey, U.S. Department of Transportation*

### 3.1.2.3 Transit

The ease, widespread availability, and comparative cost of using passenger cars compared to other transportation modes increased dramatically throughout the 20th century. Changes in land-use patterns, increased development in suburban areas, and the relatively higher allocation of funding to highway projects has resulted in a relatively sustained decline in transit ridership levels from 1960 onward. During the 1970s, transit ridership decreased to approximately 60 percent of 1960 levels. Based on data published by the American Public Transportation Association (APTA), transit ridership returned to 1960 levels in 1990, decreased again during most of the decade, and then bounced back to historical levels in 2000. Since 2000, transit ridership has continued to grow, with a small decrease in 2009. This decrease is likely due to job losses.

Figure 21 compares the annual growth in transit ridership in relation to VMT and population. Transit ridership includes both work and non-work trips. Although there has been a 10 percent increase in transit trips from 1960 to 2009, population has increased by 72 percent and VMT has increased by over 300 percent.

**Figure 21: Transit Ridership vs. VMT and Population (Indexed to 1960=1)**

Source: APTA 2011 Public Transportation Fact Book

However, passenger miles traveled (PMT) has kept pace with or exceeded highway VMT since 1995. This trend encompasses the slight decrease in transit PMT that occurred from 2002 to 2005 possibly as a result of post-9/11 fears. The growth in transit PMT may be attributed to the following factors: (i) the improved/expanded transit service in urban and suburban areas; (ii) the increased growth of suburban areas which has supported the development of long-distance bus and rail commuter lines; (iii) the increase in congestion on urban and suburban roadways, particularly to/from major employment centers; (iv) the recent increase in gasoline prices which has made transit a potentially more cost-effective means for some individuals; and (v) the increase in the number of individuals over the age of 65, who are less likely to drive. Figure 22 compares the annual change in transit PMT and highway VMT from 1995 to 2009.

**Figure 22: Transit PMT vs. Highway VMT (Indexed to 1995=1)**

Sources: APTA 2010 Public Transportation Fact Book

### 3.1.2.4 Discretionary Travel, Telecommuting and the Internet

The advent and widespread usage of the internet more than 15 years ago has brought about a whole new information age whereby many people now use it as the main tool for the retrieval and exchange of information, social communication, entertainment, and the purchase of goods and services. In theory, increased internet usage would make some vehicle trips unnecessary. According to the Federal Communications Commission (FCC), the share of U.S. households with broadband internet increased from 4 percent in 2000 to 64 percent in October 2009. According to Nielsen Online, Americans currently spend an average of nearly 60 hours per month on the internet or about two hours per day. A 2000 study by the Stanford Institute for the Quantitative Study of Society (SIQSS) included a

survey of more than 4,000 adults nationwide, which sought to evaluate how the internet has affected society. This study revealed that with more time spent online, there is a decrease in social contact, time spent commuting, and time spent shopping. These studies suggest that increases in internet usage and speed may have caused a decrease in discretionary travel.

An increase in telecommuting may have also caused a small decrease in national VMT. Individuals who work from home save on the time and expense of commuting. With the widespread availability of cell phones, high-speed internet service, and laptop computers, it has become increasingly easier for work in certain employment sectors, e.g. sales, management, professional services, and information technology, to be conducted from home. The Dieringer Research Group, Inc. in their February 2009 survey brief, "*Telework Trendlines 2009*," found that the number of employees telecommuting at least once a month doubled from 17 million in 2001 to 34 million in 2008. Nearly 14 million workers in 2008, which constituted 9 percent of the labor force, telecommute almost every day. The decrease in trips to the office likely had a small effect on the decline in VMT.

### 3.1.2.5 Age

Shifts in the age of the U.S. population will also impact VMT. Figure 23 shows how the population within each age group changed from 1900 to 2010. The post-World War II baby boom brought about a significant spike in birth rates between 1946 and 1964. However, the percentage of the population in the 20 to 44 age group, which typically produces the most VMT, has declined since 1990. At the same time, the 45 to 64 age group and the 65+ age groups have steadily increased in size.

**Figure 23: US Population Distribution by Age Group**

Source: US Census Bureau

Based on previous studies, individuals tend to gradually drive less as they age, especially after the age of 40. Figure 24 summarizes the results from the 2009 National Household Travel Survey and the number of VMT per person by age group. This data highlights the impact of an aging population on national VMT. In 2009, the 30-39 age group recorded the highest average VMT per person: approximately 15,100 for the year. The next highest groups were the 40-49 age group and the 50-59 age group which recorded slightly less than 15,000 VMT/person and 13,500 VMT/person, respectively. The 60-64 age group recorded about 11,800 VMT/person in 2009, while those in the 65-69, 70-79 and 80-99 age groups averaged about 9,800, 7,600 and 5,200 miles in 2009, respectively. With the aging of the Baby Boomer population, as shown in the previous chart, the average VMT per person had been decreasing over the past decade. This, plus increased longevity, is expected to have a

long-term effect on VMT; traffic growth is not expected to return to the rates achieved in the 1980s and 1990s.

**Figure 24: Average VMT per Person by Age Range, 2009**

Source: 2009 National Household Travel Survey, U.S. Department of Transportation

### 3.1.2.6 Women in the Workforce

Female participation in the workforce rose dramatically from the mid-1960s to around 2000, increasing from 38 percent to 60 percent of the total workforce. This trend has also contributed to the historical growth in VMT. As a result of the recent economic downturn, the participation in the workforce for each gender as a percentage of the total population has decreased. Approximately 59 percent of women and 71 percent of men currently participate in the workforce. These rates are expected to decrease with the continued aging and retirement of the Baby Boomer generation. Figure 25 summarizes the historical participation of each gender in the U.S. labor force.

**Figure 25: Participation in the Workforce by Gender**

Source: US Department of Labor Bureau of Labor Statistics

## 3.2 Regional Socio-Economic Trends

The previous section reviewed national indicators of both economic and VMT growth. In the following section trends in regional socio-economic factors are reviewed including population, employment, income, travel patterns and a comparative review of VMT and MdTA transaction trends during the most recent recessions.

In comparison with the rest of the United States, the 2007-09 recession impacted Maryland at a much later date and has been relatively shallow. Real Gross State Product (GSP) in Maryland expanded by 1.6% in 2007 and 1.3% in 2008 before contracting by -1.3% in 2009. Economic output subsequently recovered, increasing by 2.9% in 2010, but slowed to 0.9% in 2011. Unemployment in Maryland has remained relatively low with a 7.0% unemployment rate reported for August 2012. Factors that have been encouraging for economic growth in the State include the following:

- The Federal government has helped to buoy employment in the Washington, DC, which includes Montgomery and Prince George's County. The government sector accounted for 18% of Maryland's Gross State Product (GSP) in 2011. This amount was split evenly between Federal/military and state/local government;
- Other leading sectors of Maryland's economy include finance, insurance, and real estate (21% of real GSP), professional/management services (14%), and wholesale and retail trade (10%), and health care (8%), and manufacturing (7%); and
- Maryland had the 3<sup>rd</sup> highest median household income (\$64,025) in 2010, behind only New Hampshire (\$66,707) and Connecticut (\$66,452)

Despite the 2007-09 Recession, the two largest Metropolitan Statistical Areas (MSAs)—Washington, DC and Baltimore MSA—located in or adjacent to Maryland exhibited relatively strong economic growth. Real Gross Regional Product (GRP) in the Baltimore MSA increased by 1.6% and 0.3% in 2007 and 2008, respectively. There was a -0.7% decrease in real GRP in 2009 followed 3.3% increase in 2010. The Washington DC MSA experienced even less of an impact from the 2007-09 recession, as real GRP increased every year except in 2009, which remained flat from the previous year. During 2010, real GRP increased by 3.6%, comparing favorably to similar sized MSAs. 2011 data has not yet been published.

### 3.2.1 Population Trends

Between 2000 and 2010, population in the state of Maryland increased from approximately 5.3 million to 5.8 million residents, representing an average annual increase of 0.9 percent. Maryland's population is highly urbanized with sixteen of twenty-two counties forming part of a larger metropolitan area, accounting for almost 85 percent of the total population.

Population growth has been somewhat uneven as there have been stronger increases in suburban areas, while there have been population decreases in Western Maryland and in Baltimore City. In particular, six counties experienced annual growth rates in population of over 1.5 percent between 2000 and 2010. These counties include Frederick County (Washington, DC area), Queen Anne's and Cecil Counties (Eastern Shore), and Calvert, Charles, and St. Mary's counties (Southern Maryland).

Between 1990 and 2010, population in the state of Maryland increased from approximately 4.7 million to 5.8 million residents. Population growth has been especially strong during the 1990s and the 2000s, with an annual growth rate of 1.3% and 1.0%, respectively. Maryland's population is highly urban with 16 of 22 counties forming part of a larger metropolitan area, accounting for almost 85 percent of the total population.

From 2000 to 2010, the Baltimore MSA increased at average annual rate of 0.6%, while the Maryland counties located in the Washington, DC MSA increased by 1.2%. Eight counties experienced annual growth rates in population of over 1.5% between 2000 and 2010. These counties include Frederick County (Washington MSA), Howard County (Baltimore MSA), Queen Anne's, Cecil, and Wicomico Counties (Eastern Shore), and Calvert, Charles, and St. Mary's counties (Southern Maryland). The table below summarizes historical and forecast population growth for Maryland as well as five regions within Maryland defined by the Maryland Department of Planning. Table 15 shows historical population and forecast population growth for regions within Maryland as well as for the entire state.

**Table 15: Historical and Projected Population in Maryland, 1990-2040**

Year	Baltimore Metro	Washington D.C. Metro	Southern Maryland	Western Maryland	Eastern Shore	Total	CAGR (1)
1990	2,348,219	1,635,788	228,500	224,477	343,769	4,780,753	1.03%
2000	2,512,431	1,870,133	281,320	236,699	395,903	5,296,486	0.87%
2010	2,662,691	2,068,582	340,439	252,614	449,226	5,773,552	0.64%
2015	2,725,650	2,145,350	362,850	259,350	468,800	5,962,000	0.84%
2020	2,816,250	2,235,750	395,100	269,450	499,600	6,216,150	0.67%
2025	2,875,500	2,318,500	426,200	280,450	527,600	6,428,250	0.56%
2030	2,919,450	2,398,800	451,100	290,500	552,050	6,611,900	0.37%
2040	2,973,600	2,502,050	485,650	305,650	594,950	6,861,900	N/A

Sources: Maryland Department of Planning, Planning Data Services, March 2012.

(1) Compound Annual Growth Rate for Maryland

Moreover, road usage on Maryland's seven legacy toll facilities will also be impacted as a result of population growth in neighboring states. In particular, traffic coming from the

Philadelphia and Washington, DC. Metropolitan areas will likely have an impact on the John F. Kennedy Memorial Highway (I-95) as well as on the toll bridges and tunnels in Baltimore. Additionally, the William Preston Lane Jr. Memorial (Bay) Bridge (US50/301) represents a critical entry point to the tourist areas along the Eastern shore. Finally, the Governor Harry W. Nice Memorial Bridge (US 301) in Charles County, MD is another entry point to King George and Stafford counties in Virginia. Table 16 summarizes the historical and forecasted population increases in Maryland, Delaware, Washington, D.C. and its Northern Virginia suburbs, and the Philadelphia metropolitan area. In all, this region had a total population of about 13.6 million inhabitants in 2010. By 2040, total population in the region is expected to increase to beyond 16.4 million, representing a 0.6 percent annual average increase.

**Table 16: Historical and Projected Population in Maryland and in Adjacent States and Major Metropolitan Areas, 2000-2040 (in thousands)**

Year	Maryland	District of Columbia	Delaware	Northern Virginia	Southern Penn.	Total	CAGR (1)
1990	4,780,753	606,900	666,168	1,527,636	3,728,909	11,310,366	0.93%
2000	5,296,486	572,053	786,408	1,908,100	3,849,664	12,412,711	0.93%
2010	5,773,552	601,723	899,773	2,334,423	4,008,994	13,618,465	0.77%

(1) Compound Annual Growth Rate for Total

### 3.2.2 Labor Force and Employment Trends

The growing population in Maryland has had a direct influence on the state's labor force and employment. From 1990 to 2010, total employment in Maryland increased by approximately 627,000, which translates into an average annual growth rate of 1.0% during this period. Recent projections prepared by the Maryland Department of Planning estimate that total employment will increase by approximately 1.21%/year through 2015, decreasing to an estimated 1.05%/year from 2015 to 2020. This would represent the addition of approximately 209,000 and 190,000 net new employment from 2010 to 2015 and from 2015 to 2020, respectively. Employment growth has been projected to gradually taper down to 0.42%/year from 2030 to 2040. The table below summarizes the historical and forecast labor force in Maryland and for the five regions defined by the Maryland Department of Planning.

**Table 17: Historical and Projected Labor Force in Maryland, by Region 1990-2040**

Year	Baltimore Metro	Washington, DC Suburbs	Southern Maryland	Western Maryland	Eastern Shore	Total	CAGR (1)
1990	1,391,299	957,334	92,345	116,821	179,450	2,737,249	1.14%
2000	1,514,491	1,087,993	124,138	130,198	208,382	3,065,202	0.94%
2010	1,641,071	1,201,142	156,230	136,648	229,727	3,364,818	1.21%
2015	1,738,900	1,276,100	169,300	141,600	248,000	3,573,900	1.05%
2020	1,821,400	1,348,900	182,300	147,600	264,600	3,764,800	0.58%
2025	1,869,400	1,387,600	191,700	152,400	275,000	3,876,100	0.43%
2030	1,907,000	1,417,400	197,600	155,200	282,600	3,959,800	0.42%
2040	1,982,600	1,476,500	211,000	160,300	297,500	4,127,900	N/A

Source: Maryland Department of Planning, Planning Data Services, March 2012

(1) Compound Annual Growth Rate for Maryland

From 2000 to 2005, it is estimated that over 250,000 net new jobs were created in Maryland; this is about 1.6 percent growth per year. Employment growth has been fairly strong across most regions in the state. This strong growth was tempered from 2005 to 2010, with an estimated addition of only 50,000 net new jobs. Table 18 summarizes the total number of full- and part-time jobs in the five Maryland regions. Employment is forecasted to return to previous growth rates of between one and two percent per year depending on the region, after the lower growth because of the recession. Longer term, growth rates are expected to be slightly lower than this as the employment markets become more saturated. Because the total employment includes out-of-state commuters (e.g. from District of Columbia, Delaware, and Pennsylvania) and individuals with multiple jobs, the total number of jobs exceeded total labor force in 2005.

**Table 18: Number of Total Jobs by Maryland Region, 1990-2025**

Year	Baltimore Metro	Washington, DC Suburbs	Southern Maryland	Western Maryland	Eastern Shore	Maryland	Maryland CAGR (1)
1990	1,391,299	957,334	92,345	116,821	179,450	2,737,249	
2000	1,514,491	1,087,993	124,138	130,198	208,382	3,065,202	1.14%
2005	1,608,651	1,182,606	146,974	137,353	233,192	3,308,776	1.54%
2010	1,638,800	1,196,800	157,000	135,900	231,300	3,359,800	0.31%
2015	1,742,800	1,280,400	172,600	141,600	251,900	3,589,300	1.33%
2020	1,826,800	1,350,500	185,500	147,000	268,400	3,778,200	1.03%
2025	1,873,700	1,388,800	195,300	151,100	277,900	3,886,800	0.57%

Source: Maryland Department of Planning, Planning Data Services, May 2011

(1) Compound Annual Growth Rate for Maryland

During the previous decade, employment growth in Maryland has been extremely strong in the education and health services, professional services, government, technology, and

tourism industries. The Maryland Department of Business and Economic Development has forecasted that employment in these sectors will continue to remain strong in the short-term. According to the 2010 Census, Maryland had the second highest percentage (26.1 percent) of professional and technical workers as a percentage of the total employment. In particular, the technology sector currently employs an estimated 87 out of every 1,000 private sector workers, ranking 4th in the United States. Additionally, employment in the construction and natural resources sector increased of 2% from 2011 to 2012. This increase has occurred despite a de facto moratorium on natural gas drilling. Similar to other regions in the U.S., the manufacturing sector has experienced a reduction in total employment in recent years. The table below summarizes the 15 largest employers in the State of Maryland in 2011.

Table 19: Largest 25 Employers in State of Maryland, 2011

Employer	Employment	Industry
Fort George G. Meade	44,540	Military installation/intelligence
University System of Maryland	36,380	Higher education

While tracking national trends, unemployment in Maryland has remained below that of the U.S. Unemployment increased during 2001 recession and during 2007-09 recession. Unemployment is not uniform across the state as the unemployment rate in the Washington, DC MSA was 5.6%, but 7.7% in the Baltimore MSA, as of August 2012. Figure 22 summarizes regional, state, and national unemployment rates tracked by the Bureau of Labor Statistics (BLS) from 1998 to August 2012.

**Figure 26: Baltimore MSA, Maryland and National Unemployment Rates, 1998 to 2011**

### 3.2.3 Wages and Income

Real income is a key indicator of the direction and strength of the local economy. The table below presents actual and forecast real per capita income for each of the Maryland planning regions. Statewide, real per capita income increased by an average of 1.7%/year from 1990 to 2010. The Maryland Department of Planning has forecasted that income growth will remain relatively strong with average annual increase of 2.0%/year from 2010 to 2020.

**Table 20: Real Personal Income Per Capita, by Maryland Regions, 1990 to 2040, (2005 Dollars)**

Year	Baltimore Metro	Washington, DC Suburbs	Southern Maryland	Western Maryland	Eastern Shore	Maryland	Maryland CAGR (1)
1990	30,018	36,658	27,467	21,598	25,059	31,423	2.1%
2000	37,448	43,951	34,384	26,352	30,836	38,609	1.3%
2010	44,254	48,177	39,774	31,412	34,847	44,121	2.0%
2020	54,340	57,970	49,040	38,505	43,095	53,753	0.9%
2030	59,625	62,638	54,547	42,579	47,117	58,629	0.8%

(1) Compound Annual Growth Rate for Maryland

In 2010, Maryland ranked 3rd out of 51 states and the District of Columbia with a median household income of \$64,025. In real terms, median household income increased by an average annual rate of 0.4% from 1985 to 2010. This growth rate takes into account the statewide decline in real household income during the 1990s as well as national economic trends. The average annual growth rate of median household income in Maryland was above that the U.S. (0.3%/year) and commensurate to Virginia and Pennsylvania (0.4%/year) during the same period. Median household income in the District of Columbia has increased by 1.2%/year. With the onset of the 2007-09 recession, real household income in Maryland declined by an aggregate of -7.2% since 2007 (-3.1%/year). Nationally, real median household income has decreased steadily since 2000. Additionally, Maryland has the second lowest poverty rate for 2011, with 10.1% of the population living in poverty, compared with 15.9% for the U.S.

Figure 27: Median Household Income, 2010\$

### 3.2.4 Commuting Patterns in Maryland

According to the Maryland Department of Planning, nearly 470,000 Maryland residents commuted to employment areas outside of the state in 2010, the most recent year in which data was available. Approximately 85% of these commuters work in either Washington, D.C. or Virginia. Another 9% of out-of-state commuters work in either Pennsylvania or Delaware with remaining commuting to work in other states. In comparison, approximately 270,000 out of state residents commute to work in Maryland. The number of commuters who come to work into Maryland is greatest from Virginia (31% of total commuters), Pennsylvania (25%) and Washington, D.C. (19%). Overall, the percentage of Maryland residents who work within the state was estimated to be 39.3%, out-of-state commuters accounted for 60.7% of total commuters. The average commuting time was 31.8 minutes in 2010 (up from 31.2 minutes in 2000).

Similar patterns have been recorded for the Baltimore MSA and Washington, DC MSA as 39.0% and 39.6% of commuters, respectively, work in the same jurisdiction (or county) in which they reside. In the two largest counties in terms of population and employment within the Baltimore MSA—Baltimore County and Anne Arundel County—this percentage was roughly 41%. In both of counties, there was an estimated of 79.4% of total commuters who drive alone to work and 9.7% of commuters who carpooled. Baltimore County had a slightly higher percentage of commuters who used public transit in 2010. Compared to 2000, average travel times increased to 28.5 minutes for Baltimore County and 29.3 minutes for Anne Arundel County.

At a county level, a somewhat different distribution exists in the Washington, D.C. MSA. In Montgomery County, an estimated 49.4% of residents commute within the county, which is significantly higher than the statewide average. In contrast, this percentage is 28.8% in Prince George's County. In 2010, an estimated 64.8% of Montgomery County commuters drove alone, 11.1% carpooled, and 15.1% used public transit. Average commuting time increased from 32.8 minutes in 2000 to 34.0 minutes in 2010. In Prince George's County, an estimated 64.7% of commuters drove alone, 12.8% carpooled, and 17.0% used public transit in 2010. The mean commuting time decreased slightly from 35.9 minutes in 2000 to 34.7 minutes in 2010. Based on data compiled for the 2000 and 2010 census, the table below summarizes the percentage of commuters by transportation mode and mean travel time to work for 2000 and 2010 for the four most populous counties and for the entire state.

**Table 21: Commuting Patterns for Workers in Baltimore County, 2000**

Area	Total	Drove Alone		Carpool		Public Transit/Other		Mean Travel Time
Baltimore County	196,915	153,815	78.1%	19,875	10.1%	20,395	10.4%	22

Source: Maryland Department of Planning

To augment the year 2000 data available from the Maryland Department of Planning, general commuting patterns for the Baltimore region were collected from the 2010 US Census and presented in Table 22. It is interesting to note that the lower public transit percentages of the suburban communities of Baltimore are supplemented by increased percentage of people working from home. This is less demonstrated in the counties that are suburban to Washington D.C.

**Table 22: Commuting Patterns in Baltimore Region**

Area	Drive Alone	Carpool	Public Transit	Work From Home	Other
Baltimore County	79.4%	9.7%	4.3%	3.5%	3.1%
Baltimore City	60.0%	11.4%	17.6%	2.6%	8.4%
Harford County	84.0%	8.8%	0.9%	4.4%	1.9%
Carroll County	82.8%	8.2%	0.7%	5.7%	2.6%
Anne Arundel County	79.4%	9.7%	3.2%	5.0%	2.7%

Total	71.8%	10.7%	9.8%	4.3%	3.4%

### 3.2.5 Statewide Economic Forecast

Economic growth and employment in Maryland has historically followed national trends, but overall economic conditions have tended to be stronger due to the large number of professional employees, the state's close proximity to the Federal government offices in Washington, D.C., and relatively high median house income. Additionally, the value of exports transported through the Port of Baltimore has increased by 135% from 2006 to 2011.

These strengths also represent potential vulnerabilities. Proposed reductions in federal spending in 2013, particularly in the defense industry, could impact Maryland more deeply relative to other states. Moreover, a potential slowdown in global economic conditions would lead to a decrease in exports, particularly to China and Europe.

Absent these uncertainties, Maryland economy is expected to grow at a relatively healthy rate. An economic forecast prepared by Chase and JP Morgan in early 2012 forecasted that statewide real GSP would increase by 2.7% and total employment would increase by 1.1% in 2012. A three-year forecast the annual change in statewide economic output and employment is provided in the table below.

**Table 22: Maryland Economic Forecast, 2012-14**

	<b>2012</b>	<b>2013</b>	<b>2014</b>
Real GSP	2.7%	3.5%	4.2%
Employment	1.1%	1.7%	2.0%

## 4.0 Transactions and Revenue Forecasts

For the purpose of developing traffic and revenue projections for the MdTA facilities, Jacobs developed two scenarios. The first assumes no change in the toll rates in FY 2014 (No Toll Increase Model) and the second scenario includes the FY2014 toll increase which will be implemented in July 2013 (Toll Increase Model). The purpose of this distinction is to provide a review of the impact of the toll increase.

### 4.1 Traffic and Toll Revenue Forecasts

In this section the transaction and toll revenue forecasts are presented. First the development and function of the two traffic and toll revenue models that estimate revenue for the two scenarios is described, and the assumptions of the model are provided including the understanding of transportation improvements in the region.

#### 4.1.1 Traffic and Toll Revenue Model

The traffic and toll revenue models with resulting transaction and toll revenue estimates and projections were made independently by facility, based on data through August 2012, representing the full 2012 fiscal year and the first three months of FY2013. The work, analyses, and results are of investment-grade quality and suitable for financing.

The No Toll Increase Model uses actual traffic and toll revenue data provided by MdTA as the foundation. These data were provided by month from FY2004 through FY2012 and annually since facility inception. The No Toll Increase Model forecasts facility specific transactions by the following vehicle and payment classes:

- Passenger Car Commuter Cash;
- Passenger Car Commuter ETC;
- Passenger Car Non-Commuter Cash;
- Passenger Car Non-Commuter ETC (MdTA EZ-Pass) ;
- Passenger Car Non-Commuter ETC (Non-MdTA EZ-Pass);
- Commercial Vehicle Cash;
- Commercial Vehicle ETC; and
- Official Duty/Violations.

A passenger car is defined as a two-axle and commercial vehicle as having 3 or more axle. Passenger car and commercial vehicle transactions were forecasted independently by facility based upon historical and projected correlation with the Gross Domestic Product and

Industrial Production Index, respectively. The forecasts by vehicle type were then disaggregated into applicable payment categories based upon historical and projected participation trends. These forecasted transactions were then adjusted to account for the remainder of the impact of the FY2012 toll increase based on the experience from the 6 months prior experience under the new toll policies. These forecasted transactions by payment type were then converted to toll revenue estimates based on the historical and projected average toll by the respective vehicle and payment classes.

The Toll Increase Model was developed to accommodate the planned toll adjustments in FY2014. Appendix A provides the new toll schedule by facility and payment class as assumed in the development of the estimates. The Toll Increase Model uses the No Toll Increase Model as its basis incorporating short and long term economic trends that are the primary drivers of the forecast. Using the traffic data resulting from the FY2012 toll increase, elasticity factors by payment type and vehicle class were developed. These factors were reviewed and adjusted to arrive at a conservative estimate of future transactions under the planned FY2014 toll increase. These decisions are made for each facility for each payment and vehicle class as described previously.

Movement off of any particular facility is based upon price elasticity of demand factors developed by payment and vehicle class. It has been understood from past toll increases as well as previous modeling efforts that the MdTA facilities are relatively inelastic as they provide connection across natural water barriers therefore there are limited alternative routes that can be taken to avoid the toll facilities. A reduction of trips on MdTA facilities in response to an increase in total trip cost can come in many forms including simple reduced trip making by motorists, trip chaining (combining what were previously multiple trips into one; i.e. school and shopping trips), use of alternate routes or modes of travel and carpooling among others.

For this analysis a conservative approach to elasticity was taken due to the continued uncertainty of the underlying economics that drive traffic demand. Overall elasticity rates for the analysis were between 0 and -0.15, meaning for a 100 percent toll increase it would be expected that there would be a reduction in transactions of 0 to 15 percent. The elasticity rates that were used in this analysis are approximately twice the historical elasticity rates experienced on the MdTA System, resulting in a conservative forecast.

Once traffic by payment and vehicle class under the planned toll increases is determined in the model, gross toll revenue is calculated for each class. Under the planned toll schedules there will be opportunity for motorists without E-ZPass transponders to travel through non-gated lanes and pay the MdTA through the mail. The MdTA will take a picture of the license plate, look up the car registration address through the appropriate Department of Motor

Vehicles and send an invoice in the mail. This payment class will incur a fifty percent surcharge on the cash toll rate. The model estimates that 68 percent of these transactions will be paid and thus does not recognize 100 percent collection of revenue from this payment class. The other payment classes (cash and E-ZPass) are assumed to provide full collection of gross toll revenue as anticipated from the transaction and appropriate toll rate as has been the historical experience.

#### 4.1.2 Roadway Planned Improvements

The model also takes into account current and planned roadway improvements. All construction and improvement projects are anticipated to have minimal effects on the existing MdTA toll facilities. The following table provides a list of potential improvement projects completed or to be completed considered in the analysis. There is uncertainty in the development of some of these long term improvement projects and as such inclusion in the table does not necessarily make comment on their probability of implementation, just the acknowledgement of potential transportation programs in the region. The analysis assumes that none of these projects will have material impact on the toll revenues for the MdTA facilities reviewed in this report.

### 4.1.3 Transactions and Toll Revenue Forecasts

As indicated in this report, the current local, national and global economic conditions are unparalleled in recent history. Jacobs has conducted extensive research in relevant historical and forecasted socio-economic parameters in order to make a viable forecast of future traffic and toll revenues. Historical transactions by facility and vehicle class were correlated to various economic and demographic data points to understand the trends. These trends then provided comparative analysis against which the forecast of the economic and demographic data points could be related in order to understand transaction potential for the future.

In addition to the current economic climate, the planned toll adjustments have been taken into account as described in the previous section. As a result of the continued sluggishness of the economy, for the no toll increase scenario (i.e. assuming no toll increase in FY2014) Jacobs is forecasting only a very slight increase in tolled traffic for the short-term, with a return to FY2007 levels (the highest previous level of transactions) estimated to occur in FY2017. This forecast was prepared to show the baseline for transactions against which the planned FY2014 toll increase will be affecting. For the toll increase scenario (i.e. with the FY2014 toll increases approved in September 2011) transactions are anticipated to decrease in FY2014 and current transaction levels (FY2012) are estimated to be reached by FY2022. Transaction and toll revenue results are summarized in Table 23 and are detailed by facility further in this section of the report. The shaded portions of the tables reflect historical data. The estimates of transactions for both the toll increase and assumed no toll increase are shown graphically in Figure 28.

Under the no toll increase scenario it is estimated that transactions on the MdTA facilities will decrease slightly in FY2013 due to the already implemented toll increase with modest growth in FY2014. From FY2014 to FY2022 it is estimated that the “new normal” growth rate will be between 1.1 and 0.9 percent, lower than growth rates experienced by the MdTA facilities from FY1995 to FY2002, with recovery from the low growth from FY2002 to FY2007 and negative growth from FY2007 to FY2010.

Under the toll increases scenario it is estimated that transactions will experience year over year losses of 1.6 percent and 5.7 percent for FY2013 and FY2014, respectively. Beginning in FY2015, it is estimated that slow, steady growth will emerge, following the growth rates of the no toll increase scenario. It is estimated that FY2022 transactions will be near FY2004 levels, representing no growth for almost twenty years, which Jacobs recognizes as a conservative forecast of transactions and subsequently in-lane toll revenue. If the experience of the FY2012 toll increase was employed directly instead of conservatively as described, losses in traffic would be anticipated to be approximately half of the current estimates. The toll increase scenario represents the forecast of transactions

and toll revenue assuming the continuing implementation of the toll adjustments approved on September 22, 2011 by the MdTA.

**Table 23: Historical and Forecasted Total Transaction and In-Lane Toll Revenue, and Annual Growth (\$ Millions)**

Fiscal Year	Transactions	Toll Revenue	Growth	
			Transactions	Toll Revenue
2000	108.2	148.2

### 4.1.5 Monthly Transactions and In-Lane Toll Revenue Forecasts

For budgeting and tracking purposes monthly estimates of both transactions and in-lane toll revenue are developed for the MdTA. Table 26 presents monthly estimates of transaction and toll revenue for FY2013 and FY2014 for the seven MdTA legacy facilities discussed in this report. This includes all planned toll adjustments. In addition the table provides a summation of the months to the full fiscal year for both FY2013 and FY2014.

**Table 26: Monthly Transaction and In-Lane Toll Revenue for the MdTA Facilities for FY2013 and FY2014**

Fiscal Year	Month	Transactions (M)	In-Lane Toll Revenue (\$M)
2013	Jul	10.580	\$37.813
2013	Aug	10.875	\$38.868
2013	Sep	9.337	\$33.371
2013	Oct	9.394	\$33.575
2013	Nov	9.562	\$34.177
2013	Dec	9.189	\$32.844
2013	Jan	8.420	\$30.094
2013	Feb	8.321	\$29.741
2013	Mar	9.441	\$33.745
2013	Apr	9.590	\$34.276
2013	May	10.141	\$36.246
2013	Jun	10.244	\$36.613
2013	Total	115.094	\$411.363
2014	Jul	9.979	\$50.072
2014	Aug	10.257	\$51.468
2014	Sep	8.807	\$44.190
2014	Oct	8.860	\$44.460
2014	Nov	9.019	\$45.257
2014	Dec	8.668	\$43.492
2014	Jan	7.942	\$39.851
2014	Feb	7.849	\$39.383
2014	Mar	8.905	\$44.684
2014	Apr	9.045	\$45.388
2014	May	9.565	\$47.996
2014	Jun	9.662	\$48.483
2014	Total	108.558	\$544.724

## 4.2 Other Revenue Forecasts

In addition to transaction and toll revenue forecasts, Jacobs has conducted analyses to provide forecasts of revenue streams that are associated with MdTA facilities. These ten other revenue streams can be broken down into five general categories as follows:

1. Commuter Plan: Unused Toll Revenue from pre-paid plan
2. Transponder
  - a. Transponder Sales (Legacy and ICC)
  - b. Monthly Service Fees (Legacy and ICC)
3. Violation
  - a. Notice of Toll Due Fees
  - b. Violation Fees (Legacy and ICC)
4. Commercial Vehicle Fees/Discounts
  - a. Post-Usage Discount
  - b. High Frequency Discount
  - c. Over-Size Permit Fee
5. Concession Revenue
6. Hatem E-ZPass Program

The forecasts of these ten revenue streams, as well as historical revenue for the applicable categories, are provided in Table 27, with a description of the analyses by category following.

**Table 27: Other Revenue Forecasts**

Fiscal Year	Unused Toll Revenue	Transponder Sales	Monthly Account Fees	Notice of Toll Due Fees	Violation Fees	Commercial Vehicle Post-Usage Discount	Commercial Vehicle High Frequency Discount	Over-Size Permit Fee	Concession Revenue	Hatem E-ZPass Program *	ICC Transponder Sales	ICC Monthly Account Fees	ICC Violation Fees	Total	Percent Increase of Total
2004	2.0				0.8	(2.3)			8.1					8.6	
2005	2.8				1.5	(3.9)			8.0					8.4	-2.3%
2006	3.5				2.8	(4.5)			7.8					9.6	14.3%
2007	4.0				3.0	(4.8)			8.1					10.3	7.3%
2008	4.3				3.0	(5.0)			8.0					10.3	0.0%
2009	4.5				1.9	(4.8)			8.0					9.6	-6.8%
2010	6.6	1.4	9.6	1.1	2.3	(6.6)	(0.2)	1.0	8.2					23.3	143.1%
2011	6.5	1.9	9.9	1.3	1.3	(6.7)	(0.3)	1.2	7.9					23.0	-1.5%
2012	9.1	1.7	4.7	0.8	2.8	(5.9)	(0.2)	1.3	7.6	0.3	0.1	0.3	1.7	24.3	5.7%
2013	9.4	1.2	4.7	-	2.8	(5.2)	(0.7)	1.3	6.1	1.3	0.1	0.3	1.7	23.0	-5.3%
2014	11.5	1.2	4.7	-	2.8	(7.2)	(0.9)	1.3	3.6	2.5	0.1	0.4	1.7	21.7	-5.7%
2015	11.6	1.4	4.8	-	2.7	(7.3)	(0.9)	1.3	6.1	2.5	0.1	0.4	1.7	24.4	12.4%
2016	11.7	1.4	4.8	-	2.7	(7.4)	(1.0)	1.3	6.6	2.5	0.1	0.4	1.6	24.7	1.2%
2017	11.8	1.4	4.8	-	2.7	(7.5)	(1.0)	1.3	6.7	2.5	0.1	0.4	1.6	24.8	0.4%
2018	11.9	1.4	4.9	-	2.6	(7.6)	(1.1)	1.3	6.7	2.5	0.1	0.4	1.6	24.7	-0.4%
2019	12.1	1.4	4.9	-	2.6	(7.7)	(1.1)	1.3	6.8	2.5	0.1	0.4	1.6	24.9	0.8%
2020	12.2	1.5	4.9	-	2.6	(7.8)	(1.1)	1.3	6.9	2.5	0.1	0.4	1.6	25.1	0.8%
2021	12.3	1.5	5.0	-	2.5	(7.9)	(1.2)	1.3	7.0	2.5	0.1	0.4	1.5	25.0	-0.4%
2022	12.4	1.5	5.0	-	2.5	(8.0)	(1.2)	1.3	7.2	2.5	0.1	0.4	1.5	25.2	0.8%

\*Prior to this forecast Hatem Bridge AVI revenue was not forecasted separately. Now that it is an E-ZPass based program, it is forecast as "other revenue" as identified in this table.

### 4.2.1 Commuter Plan

The MdTA commuter plan allows customers to pre-pay for a substantial discount at the MdTA facilities. Currently under this plan (after the FY2012 toll adjustment), commuters receive a 75 percent discount from the cash rate when purchasing 50 transactions for Central Facilities of BHT, FMT and FSK with a double charge per transaction at JFK and Hatem due to one-way tolling. For the Bay and Nice facilities 25 transaction units can be purchased at the same discount rate. All transactions are to be used within 45 days. The MdTA collects revenue from these motorists at the full discounted price and applies all unused revenue after the expiration of the window to a separate account entitled "Unused Toll Revenue". Revenue is anticipated to increase in this category mostly due to the continuing increases in tolls in FY2013 and FY2014.

### 4.2.2 Transponders/Accounts

Both of these revenue streams were newly introduced in FY2010. Transponder prices ranged from \$21 for the Standard, \$33 for the Exterior and \$40 for the Fusion transponder from July 1, 2009 to December 31, 2011. On January 1, 2012 the Standard transponder dropped to \$9 with similar reductions in price for the other styles. The forecast of future revenues from sales is based on estimated transponder growth from historical experience as well as an understanding of the mix of transponders to be sold, heavily weighted to the purchase of Standard transponders.

Monthly account fees for MdTA **E-ZPass** accounts of \$1.50 were implemented July 1, 2009. Beginning on November 1, 2011, accounts with 3 or more toll transactions in a month were exempt from this fee. Reviewing existing **E-ZPass** account data for frequency of use, estimates of accounts that will be subject to this fee were developed tempered by the closure of accounts experienced after the implementation of the fee. It is further anticipated that a slow closure of accounts for low frequency users will continue. The forecast was produced with consideration of the foregoing and anticipation of account growth based on a discounted historical trend.

The forecast for both of these fees were allocated to ICC and Legacy facilities individually to match MdTA accounting procedures.

### 4.2.3 Violation Fees

The violation fees of \$25 were estimated based on FY2010 through FY2012 actual data for fee collection in this category. The notice of toll due fee was newly introduced for FY2010. This fee is being replaced by the 50 percent surcharge for image based tolling. The revenue collected for this surcharge is included in the overall toll revenue estimate. This fee was allocated to ICC and Legacy facilities individually based on historical trends to match MdTA accounting procedures.

#### **4.2.4 Commercial Vehicles**

The post-usage discount for commercial vehicle accounts offers accounts a percent discount directly related to the total dollar amount spent per month. On January 1, 2012 the discount was restructured to reflect new thresholds and is only offered to vehicles with five axles or more. Using existing account data and historical experience, estimates of the magnitude of this fee under the new structure were developed.

The high frequency discount has also been limited to only commercial vehicle operators with 5 axles or more as well as has been restructured to offer levels of discounts for as few as 60 trips for one transponder in a month. Again, using actual transponder data the forecast for this fee was developed.

The oversize permit is a charge which replaced the “Unusual Class” of vehicles on the MdTA facilities in FY2010. The estimates of revenue for this fee were developed based upon FY2010 through FY2012 data and limited growth over time, as appropriate.

#### **4.2.5 Concession Revenue**

The MdTA collects revenue from two travel plazas along JFK Highway. Using historical data by concession site, correlating with JFK traffic levels, base forecasts were developed. It is further understood that there will be improvement projects to the travel centers resulting in various closures in FY2013 through FY2016 and limited revenue potential after FY2016 due to the structure of the procurement for the update of these travel plazas. All relevant information and data regarding the forecast of this revenue stream was provided by the MdTA staff using revenue projections developed by Areas USA MDTP, LCC, the concessionaire. The base forecast was adjusted to reflect this, with slight growth throughout the forecast period.

### 4.3 Total Revenue Forecasts

Table 28 provides the final forecasts of toll revenue and other revenue, as discussed in the previous sections.

**Table 28: MdTA Total Revenue Forecasts**

Fiscal Year	MdTA Toll and Other Revenue Estimates (\$ Millions)		
	In-Lane Toll Revenue	Other Revenue	Total Revenue
2004	251.3	8.6	259.9
2005	278.5	8.4	286.9
2006	278.8	9.6	288.4
2007	282.3	10.3	292.6
2008	279.3	10.3	289.6
2009	276.6	9.6	286.2
2010	308.5	23.3	331.8
2011	312.0	23.0	335.0
2012	373.0	24.3	397.3
2013	411.4	23.0	434.4
2014	544.7	21.7	566.4
2015	550.7	24.4	575.1
2016	556.6	24.7	581.3
2017	562.4	24.8	587.2
2018	568.1	24.7	592.8
2019	573.7	24.9	598.6
2020	579.2	25.1	604.3
2021	584.4	25.0	609.4
2022	589.7	25.2	614.9

## 5.0 Limits and Disclaimers

It is Jacobs' opinion that the traffic and toll revenue estimates provided herein are reasonable and that they have been prepared in accordance with accepted industry-wide practice. However, given the uncertainties within the current economic climate, it is important to note the following assumptions which, in our opinion, are reasonable:

- This report presents the results of Jacobs' consideration of the information available as of the date hereof and the application of our experience and professional judgment to that information. It is not a guarantee of any future events or trends.
- The traffic and toll revenue estimates will be subject to future economic and social conditions, demographic developments and regional transportation construction activities that cannot be predicted with certainty.
- The estimates contained in this report, while presented with numeric specificity, are based on a number of estimates and assumptions which, though considered reasonable to us, are inherently subject to economic and competitive uncertainties and contingencies, most of which are beyond the control of the MdTA and cannot be predicted with certainty. In many instances, a broad range of alternative assumptions could be considered reasonable. Changes in the assumptions used could result in material differences in estimated outcomes.
- Jacobs' traffic and toll revenue estimations only represent our best judgment and we do not warrant or represent that the actual toll revenues will not vary from our estimates.
- We do not express any opinion on the following items: socioeconomic and demographic forecasts, proposed land use development projects and potential improvements to the regional transportation network.
- The standards of operation and maintenance on all of the system will be maintained as planned within the business rules and practices.
- The general configuration and location of the system and its interchanges will remain as discussed in this report.
- Access to and from the system will remain as discussed in this report.
- No other competing highway projects, tolled or non-tolled are assumed to be constructed or significantly improved in the project corridor during the project period, except those identified within this report.
- Major highway improvements that are currently underway or fully funded will be completed as planned.
- The system will be well maintained, efficiently operated, and effectively signed to encourage maximum usage.

- No reduced growth initiatives or related controls that would significantly inhibit normal development patterns will be introduced during the estimate period.
- There will be no future serious protracted recession during the estimate period.
- There will be no protracted fuel shortage during the estimate period.
- No local, regional, or national emergency will arise that will abnormally restrict the use of motor vehicles.

In Jacobs' opinion, the assumptions underlying the projections provide a reasonable basis for the revenue projections and operating expenses. However, any financial projection is subject to uncertainties. Inevitably, some assumptions used to develop the projections will not be realized, and unanticipated events and circumstances may occur. There are likely to be differences between the projections and actual results, and those differences may be material. Because of these uncertainties, Jacobs makes no guaranty or warranty with respect to the projections disclosed in this Study

\* Commuter discount plans are available for customers with valid E-ZPass Maryland accounts driving two-axis vehicles.<sup>1</sup> Plans for the Bay and Nice bridges are \$25 (effective November 1, 2011) and \$52.50 (effective July 1, 2013) and offer 25 trips. The Baltimore Regional Plan is \$37.50 (effective November 1, 2011) and \$70 (effective July 1, 2013) and offers 50 trips. Note: two "trips" are deducted at the Kennedy Highway and Hatem Bridge for the Baltimore Regional Plan. Plans end after 45 days or when all of the trips are used, whichever comes first.

#### Approved changes to the Hatem Bridge AVI Decal program:

- The AVI Decal will transition to E-ZPass Hatem Bridge plans by Sept. 30, 2012. Customers may continue to purchase AVI Decals for \$10 until August 31, 2012; however, all decals expire on Sept. 30, 2012, if they have not already expired before that date. No refunds will be provided for AVI decals. Effective February 1, 2012, AVI decals will no longer be sold in the toll lanes.
- Two E-ZPass Hatem Bridge plans will be available to replace the AVI Decal:
  1. Hatem Bridge-Only Plan will be offered for two-axis vehicles only in which a valid, properly mounted transponder provides unlimited trips for the Hatem Bridge ONLY. No monthly account fees or pre-paid tolls will be required for this plan. This plan begins on February 1, 2012, and costs \$10 per year. On July 1, 2013, the price increases to \$20 per year. E-ZPass transponders will be provided at no charge for the Hatem Bridge-Only Plan until January 31, 2013.
  2. For existing or new E-ZPass Maryland customers, this plan may be added to individual transponders on an E-ZPass Maryland account. Please note that these accounts are still subject to account and transponder fees and pre-paid toll deposits in addition to the annual plan fee.

#### Approved changes to the Hatem Bridge A-Series and T-Series Ticket Books:

- The existing ticket programs will be phased-out for vehicles with three or more axes.
- Sales of T-Series tickets (used for light trailers in conjunction with the AVI Decal) ends on August 31, 2012. Acceptance of T-Series tickets end on September 30, 2012, when AVI decals expire. Prices for T-Series tickets increase by 50% on November 1, 2011, and on April 1, 2012. No refunds will be provided for T-Series tickets.
- Sales of A-Series tickets for vehicles with five axes end on December 31, 2011. Prices for A-Series tickets for vehicles with three and four axes increase by 50% on January 1, 2012; July 1, 2012; and January 1, 2013. On May 31, 2013, ticket sales end; all A-Series tickets will have expired by July 1, 2013. No refunds will be provided for A-Series tickets.

#### The MDTA also approved additional changes effective November 1, 2011:

- Reflected in the above tables, a 10% discount off the two-axis Cash/Base rate for two-axis vehicles having a valid E-ZPass Maryland account with an operable, properly mounted transponder (except if the transponder already has a discount plan associated with it for that facility).<sup>1</sup>
- Reflected in the above tables, commuter discount rates are now uniform for all fixed toll facilities -- a 75% discount off the Cash/Base toll (effective November 1, 2011) and a 65% discount off the Cash/Base toll (effective July 1, 2013).<sup>1</sup>
- Waive the \$1.50 E-ZPass Maryland monthly fee on accounts used to pay three or more tolls in the previous month at MDTA facilities.
- For fixed-toll facilities, replace the \$3 Notice of Toll Due fee with a Video Toll rate that is 150% of the Cash/Base toll. There is a minimum video surcharge of \$1 and a maximum of \$15.
- For the Intercounty Connector (ICC)/MD 200, replace the \$3 Notice of Toll Due fee with Video Toll Rate ranges that are 150% of the current toll mileage rate ranges. There is a minimum video surcharge of \$1 and a maximum of \$15. For additional details, visit [www.mdtamaryland.gov](http://www.mdtamaryland.gov).
- Modify the Bay Bridge Shoppers Discount Plan to be a 50% discount for 10 trips that are valid for 90 days, good Sunday through Thursday only. The discount plan costs \$20 (effective November 1, 2011) and \$30 (effective July 1, 2013).
- Reflected in the above tables, all Cash tolls are now set to whole dollar amounts.<sup>1</sup>

#### The MDTA also approved additional changes effective January 1, 2012:

- The post-usage discount program, which has been restructured, is limited to vehicles with five or more axes.<sup>1</sup> Visit [www.mdtamaryland.gov](http://www.mdtamaryland.gov) for new post-usage rebate rates.
- For three- and four-axis vehicles, the multipliers used to set the tolls have been reduced and are reflected in the above tables.<sup>1</sup>
- The supplemental rebate program is modified to apply only to vehicles with five or more axes and is expanded to provide rebates to vehicles making 60 or more trips per month.<sup>1</sup> Refer to the website below for the supplemental rebate rates.

<sup>1</sup> Does not apply to the ICC.

For more information visit [www.mdtamaryland.gov](http://www.mdtamaryland.gov).
